DECLARATION

I hereby declare that the research thesis entitled "FACTORS AFFECTING INDIVIDUAL CUSTOMERS' DECISION TO DEPOSIT MONEY AT SAIGON – HANOI COMMERCIAL JOINT STOCK BANK" is entirely my own research work and the content presented in this thesis is completely truthful.

The data and tables serving the analysis and guidance of this topic are collected from various sources and are noted in the reference section or notes right below the tables.

In addition, for interpretive documents to further clarify the points analyzed and cited in the appendix, the data origin is also annotated.

Hanoi, July 2024

DINH VAN ANH

ABSTRACTS

This study aims to examine the factors affecting individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank (SHB). Using a quantitative methodology through SPSS software, the research collected data from 200 SHB customers through an online survey conducted via smartphones. The study also identifies limitations, including a restricted sample size and reliance on online data collection, which may affect the generalizability of the results. These insights provide a foundation for further research and offer strategic recommendations for SHB to improve its deposit services and maintain a competitive edge in the banking industry.

CHAPTER 1: INTRODUCTION

1.1 Rationale of the research

In recent years, Vietnam has emerged as a promising market for investment and development, distinguished by a high economic growth rate compared to other countries in the region. The country has actively pursued market expansion and international integration, fostering opportunities to learn from global best practices and enhance domestic products and services. Consequently, the competition between domestic commercial banks and foreign banks investing in Vietnam has intensified. In this competitive environment, Vietnam's commercial banking system is increasingly focused on enhancing operational quality and sustaining its competitive edge. Capital mobilization is a fundamental activity of commercial banks, essential for securing the funds necessary to support various business operations. Among the sources of capital, customer deposits, particularly those from individual customers, constitute a substantial portion and have a direct impact on the bank's mobilization activities.

Presently, a prevalent circumstance persists wherein the majority of Vietnamese banks experience a shortage of medium and long-term capital essential for investment requirements. In particular, individual customers exhibit a proclivity towards short-term deposits amidst a milieu characterized by low interest rates. This inclination poses a considerable risk of interest rate exposure, particularly as market fluctuations persist due to economic influences and escalating competition within the banking industry. Furthermore, the escalating diversity in customer demands necessitates perpetual market adaptation by commercial banks to develop products and services, thereby fostering customer retention and prospective clientele acquisition. One of the paramount objectives for all commercial banks in Vietnam is to maintain capital mobilization at steadfast costs, with personal savings establishing themselves as a pivotal mobilization source and garnering significant customer appeal. Therefore, it is fundamental to comprehend the factors affecting each customer's deposit decision.

Several foreign studies have researched the factors influencing customers' decisions to deposit money, including research on Islamic banks by Farah Zakiah et al. (2016) and studies on students' bank selection in South Africa conducted by Cleopas Chigamba et al. (2011). In the Vietnamese context, numerous authors have explored this issue within

various commercial banks, such as Vietinbank (Nguyen Ngoc Duy Phuong et al., 2018; Giang, Phan Thi Huong, 2023), Vietnamese commercial banks (Bui Nhat Vuong et al., 2020), SCB (Le Trung Hieu, 2021), and VIB (Ngo Thi Nga et al., 2021). However, there exists a research gap on the factors influencing individual customers' deposit decisions, specifically at Saigon – Hanoi Commercial Joint Stock Bank. Presently, SHB ranks among the top 12 Vietnamese banks in the Global 500 list of banks with the highest brand value, as assessed by Brand Finance. Consequently, the objective of this study is to guarantee the ongoing growth of deposit mobilization and to provide several suggestions that enhance SHB's capacity for acquiring deposits.

1.2 Objectives of the research

The purpose of this study is to comprehend and analyze previous studies as well as theories on customer behavior or decision-making at commercial banks in order to identify and clarify the factors affecting individual customers' deposit decisions at Saigon - Hanoi Commercial Joint Stock Bank.

Specific objectives

- Clarifying individual deposits and the role of individual deposits in banking activities.
- Synthesize the theoretical framework of customer behavior and evaluation models.
- Research and analyze the factors in the proposed model; identify factors affecting individual customers' deposit decisions at Saigon - Hanoi Commercial Joint Stock Bank.
- Evaluate the relationship between factors and individual customers' deposit decisions at Saigon - Hanoi Commercial Joint Stock Bank.
- Propose and recommend solutions to further develop deposit services of Saigon - Hanoi Commercial Joint Stock Bank.

Research question

- What are the factors affecting individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank?
- What characteristics of at Saigon – Hanoi Commercial Joint Stock Bank's deposit money services do customers find important?
- How to enhance deposit money services at Saigon – Hanoi Commercial Joint Stock Bank?

1.3 Object and Scope of the research

1.3.1 Research subjects

- Factors affecting individual customers' decisions to deposit money in commercial banks.

1.3.2 Scope of the research

- Determining factors affecting individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank.

Primary data

- Data was collected through a questionnaire survey for SHBs' individual depositors.
- Research space: Saigon – Hanoi Commercial Joint Stock Bank.
- Time to conduct the survey: May 27, 2024 – June 8, 2024.

Secondary data

- SHB's financial statements and annual reports.
- Research articles and articles about customer behavior or decision-making about SHB's deposit money.

1.4 Research method

This study employs a quantitative research methodology, utilizing data gathered via questionnaires administered in May and June 2024.

Quantitative research emphasizes the analysis of numeric and unchanging data and aims for detailed and precise findings. This formal investigation gathers information from individual customers depositing money at Saigon – Hanoi Commercial Joint Stock Bank. Data processing will be conducted using SPSS software and Excel to ensure robust and reliable results.

1.5 Contribution of the research

The research identifies the factors affecting individual customers' decisions to deposit money at commercial banks to serve as the foundation for the study of the quality of deposit services affecting customer decisions at Saigon - Hanoi Commercial Joint Stock Bank for the period of 2020 – 2023. Therefore, the study proposes possible solutions and the real value in deposit money development at SHB in the coming years.

This thesis applies the Theory of Planned Behavior, the Theory of Reasoned Action, and a research model built from previous empirical research to evaluate the quality of deposit services at Saigon – Hanoi Commercial Joint Stock Bank.

1.6 Structure of the research

This dissertation is structured into five chapters for research objectives and the preceding study questions:

Chapter 1: Introduction

This chapter provides an overview of the research topic, highlighting its urgency, objectives, and scope. In addition, Chapter 1 also outlines the theoretical basis, related research, and research methods for the topic.

Chapter 2: Literature review

This chapter will provide an overview of bank deposits for individuals, theoretical models related to the topic and influencing factors.

Chapter 3: Research design

An introduction to research methodology, including: research methods, research samples, data resources, and research design.

Chapter 4: Results and Discussion

In this chapter, the dissertation will provide results and suggestions for model research on factors affecting individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank.

Chapter 5: Conclusion

The final chapter will provide some recommendations to overcome existing limitations and improve the quality of deposit money services.

CHAPTER 2: LITERATURE REVIEW

2.1. Overview of bank deposit for individual customers

2.1.1. Definition of bank deposit, bank deposit for individual customers

2.1.1.1. Bank deposit

Previous studies have introduced the concept of bank deposits from various perspectives, focusing on their role, definition, and impact on the banking system and economy. Van Dahm (1995) emphasized that deposits are surplus funds from individuals, businesses, investors, and governments placed into financial institutions. This perspective highlights the origin and sources of these funds, which include investments, loans, cash, and checks. Ahmed (2010) provided a functional definition, describing deposits as money that customers entrust to banks with the expectation of being returned upon request or after a specified period. This definition emphasized the operational aspect of deposits, emphasizing the bank's obligation to return the funds under agreed terms. Furthermore, Keynes' Monetary Theory views bank deposits as a significant component of the money supply, enhancing economic liquidity by being easily convertible into cash or available for transactions. Bui Nhat Vuong et al. (2020) stressed the critical impact of deposits on a bank's liquidity and their status as the primary source of funding for most banks, indicating their vital role in the financial stability and lending capacity of banking institutions. These opinions collectively offer a comprehensive understanding of bank deposits, addressing their sources, functional definitions, and economic significance. The activities related to banks acquiring deposits in Vietnam include the collection of funds from individuals and enterprises through demand, term, savings, and other deposit types, as well as other financial instruments such as bonds and bills. Commercial banks have to ensure the full repayment of principal and interest to depositors in compliance with pre-established agreements when depositing money. In order to maintain financial stability and encourage economic growth, these deposit-receiving activities are essential to the banking industry because they give customers a secure and trustworthy place to save their funds. To sum up, bank deposits are amounts of money that individuals or institutions put into banks for purposes such as safety, profitability, or payment.

Bank deposits are essential to the stability and effectiveness of the banking industry, as they are a main source of funding for financial institutions and a primary source of funding for banks. Moreover, bank deposits contribute significantly to enhancing

economic liquidity while simultaneously offering depositors the opportunity to accrue interest on their funds.

2.1.1.2. Bank deposit for individual customers

In a broader sense, bank deposits for individual customers refer to funds placed into a bank account by individuals. These deposits may take various forms, including cash, checks, or electronic transfers, providing depositors with a secure avenue for money storage, interest accrual, and transaction facilitation. Keynes emphasized the importance of individual deposits, particularly time deposits, in sustaining economic stability and promoting consumer spending. Presently, individual bank deposits are integral components of the overall money supply of commercial banks. These deposits offer the economy liquidity and function as a basis for credit extensions and loan origination via banks.

2.1.2. Types of bank deposits for individual customers

Bank deposits for individual customers can be classified into some main types, including the following:

Demand deposits

Demand deposits are funds deposited in accounts that can be withdrawn by the depositor at any time without prior notice to the bank. Demand deposits offer the highest level of liquidity, providing immediate access to deposited funds for transactions and withdrawals. They are typically used for daily financial activities and do not accrue interest compared to other types of deposit accounts, as the primary focus is on providing convenient access to funds rather than maximizing returns. Overall, demand deposits play a crucial role in facilitating day-to-day financial activities and are widely used by individuals and businesses to manage their liquid assets.

Savings deposits

Savings deposits are a crucial financial instrument for individuals, providing a secure and accessible means to store funds while earning interest. These accounts are designed to encourage regular saving habits by offering periodic interest on the deposited funds, albeit at a lower rate compared to time deposits. Savings deposits strike a balance between liquidity and earning potential, allowing for relatively easy access to funds

through bank branches, ATMs, online banking, and mobile applications, while imposing some limitations on the frequency of withdrawals and transfers. This makes them particularly suitable for managing emergency funds and achieving personal financial stability. The low or nonexistent minimum balance requirements of savings accounts make them accessible to a broad range of individuals, further promoting financial inclusion. Additionally, these deposits are typically insured by government-backed schemes, providing a high level of security against bank failures.

Term deposits

Term deposits, also known as time deposits, represent a secure and structured method for individuals and businesses to accumulate interest on their savings over a fixed period of time. With a fixed duration and interest rate, these accounts restrict early withdrawals without charges. Term deposits are preferred because they are more reliable and predictable than ordinary savings accounts and offer greater interest rates. Banks may rely on term deposits as a stable source of funding even with their limited liquidity since they can use these funds to provide loans for customers and earn on the difference in interest rates. Depositors can choose to withdraw their money at maturity or renew their deposit; interest is usually paid out either at the end of the term or on a periodic schedule. An example of a term deposit that is frequently used to assist individuals in achieving their financial goals is a certificate of deposit (CD). Compared to conventional savings accounts, term deposits provide higher interest rates but more stringent liquidity requirements, which makes them more closely aligned with long-term financial planning and customized savings objectives. Overall, term deposits are an effective means of wealth accumulation, which plays a major role in supporting individual financial goals and the operations of financial institutions.

2.1.3. Roles of bank deposits for individuals

Bank deposits play a vital role in the financial system as the primary source of funds that banks use to provide loans and facilitate investments.

Firstly, deposit money is an effective financing tool for financial intermediation and liquidity management. According to the Theory of Financial Intermediation and Keynes, when individuals and households deposit their savings in banks, these institutions aggregate the funds and allocate them to various borrowers, including businesses and

homebuyers. This process enables the efficient transfer of idle savings into active capital, promoting economic growth and development. The profitability of banks is derived from the interest rate spread, which is the difference between the interest paid to depositors and the interest charged on loans. Consequently, bank deposits are fundamental not only for maintaining liquidity within the banking system but also for ensuring a steady flow of credit to the economy driven by loans and investments.

Secondly, bank deposits play a pivotal role in generating interest income for individuals, significantly contributing to their wealth accumulation over time. According to classical economic theory, particularly Irving Fisher's theory of interest, individuals allocate their resources between consumption and saving based on their time preferences. By placing their savings in interest-bearing accounts, such as savings accounts or certificates of deposit, individuals can earn a return on their funds, effectively compensating them for deferring immediate consumption. This interest income not only helps preserve the real value of savings against inflation but also facilitates wealth accumulation through the compounding of interest over time.

Thirdly, depositing money in banks offers protection against loss or theft and provides peace of mind, aligning closely with the Life Cycle Hypothesis's emphasis on precautionary savings. By placing funds in bank accounts, individuals mitigate the risk of losing their savings to theft or unexpected mishaps. This protective function of banking institutions allows savers to build a financial cushion to address various contingencies, such as emergencies, health-related expenses, or periods of unemployment. Consequently, depositing money in banks not only facilitates the preservation of wealth but also fulfills a fundamental need for risk management and contingency planning in individuals' financial lives.

Bank deposits are essential to the financial system, providing key functions for economic stability and individual financial security. They enable effective financial intermediation and liquidity management, turning idle savings into productive investments. Bank deposits also generate interest income, aiding wealth accumulation and inflation protection. Additionally, they offer security against loss and theft, aligning with precautionary saving motives and providing a financial cushion for emergencies. Thus, bank deposits are vital for both personal finance and broader economic health.

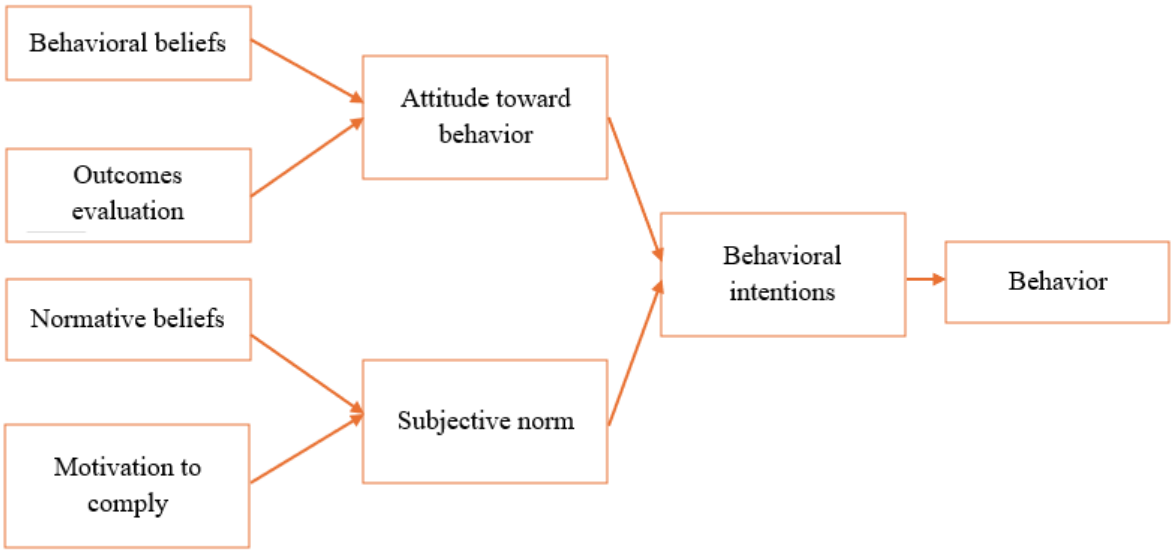

2.2. Fundamental theories on customers' decisions to deposit money

2.2.1. Theory of Reasoned Action

A prominent theoretical framework frequently employed to explain the relationship between attitudes and behaviors is the Theory of Reasoned Action (TRA). Originating from the realm of social psychology, the Theory of Reasoned Action (TRA) was formulated by Ajzen and Fishbein in seminal works published in 1975 and 1980. TRA comprises three fundamental constructs: behavioral intention (BI), attitude (A), and subjective norm (SN). According to TRA, an individual's inclination towards a particular behavior is contingent upon their attitude towards that behavior and the subjective norms **(BI = A + SN).** Consequently, if an individual intends to engage in a behavior, it is probable that they will enact it.

Behavioral intention assesses the degree of an individual's intent to perform a specific behavior. Attitude is determined by the individual's believes about the outcomes of the behavior, weighted by their evaluation of these results. An individual's attitude depends on their judgment of the behavior's outcomes and their beliefs. However, Fishbein and Ajzen indicate that attitudes and norms do not equally influence behavioral intention. The influence of these factors on behavioral intention can vary significantly depending on the individual and the context, and thus, a specific weight is associated with each factor in the predictive model of the theory.

Figure 2.1: Theory of Reasoned Action - TRA (Fishbein & Ajzen, 1975).

A key component of the Theory of Reasoned Action (TRA) is attitude. While there is ongoing debate among social scientists about the origins of attitudes, Fishbein and Ajzen (1975) posited that an individual's attitude towards performing a behavior is determined by the beliefs they hold about that behavior. This aspect of the TRA is derived from Fishbein's (1967a, 1967b) Summative Model of Attitude and subsequently the TRA, an attitude towards performing a behavior can be mathematically expressed with the following formula:

$$A_B = \Sigma\, b_i e_i$$

A_B represents attitude toward the behavior and this attitude is the sum of the strength of each belief (b_i) multiplied by the evaluation of each belief (e_i).

According to Daniel E. Montano et al., 2015, an individual's attitude is formed by their behavioral believes, which are weighted by assessments of their attributes or results of behaviors they engage in. A person will therefore have a positive attitude toward the activity of concern if they believe that engaging in it will lead to favorably valued consequences. On the other hand, a negative attitude could result from someone who firmly believes that their actions will have unfavorable consequences.

A subjective norm is determined by normative beliefs and the motivation to comply with these beliefs. Normative belief refers to the perceived expectations of significant others regarding a particular behavior. The motivation to act in a manner that complies with expectations, whether factual or imagined, serves as what motivates one to comply. The following formula represents the subjective norm mathematically:

$$SN = \Sigma\, b_i m_i$$

The perceived expectation or normative belief is referred to as b_i, and the motivation for adhering to such expectations is defined as m_i (James Price Dillard et al.).

An individual's subjective norm is established through their normative beliefs, which are determined by the individual's inclination to comply with the expectations of significant referents. Consequently, individuals who perceive approval from referents and are motivated to conform to their expectations maintain a positive subjective norm. Conversely, those perceiving disapproval demonstrate a negative subjective norm,

whereas individuals with lower motivation exhibit a relatively neutral subjective norm (Daniel E. Montano et al., 2015).

The Theory of Reasoned Action posits that the primary determinant of behavior is the individual's intention to engage in that behavior, which is influenced by their attitude toward the behavior and subjective norms. In particular, customers' beliefs regarding the outcomes of depositing money and the perceived expectations from significant others affect their attitude and subjective norms, respectively. Consequently, positive or negative attitudes toward depositing money and the influence of normative beliefs and motivations from various sources contribute to the intention to use or not use deposit services.

2.2.2. Theory of Planned Behavior

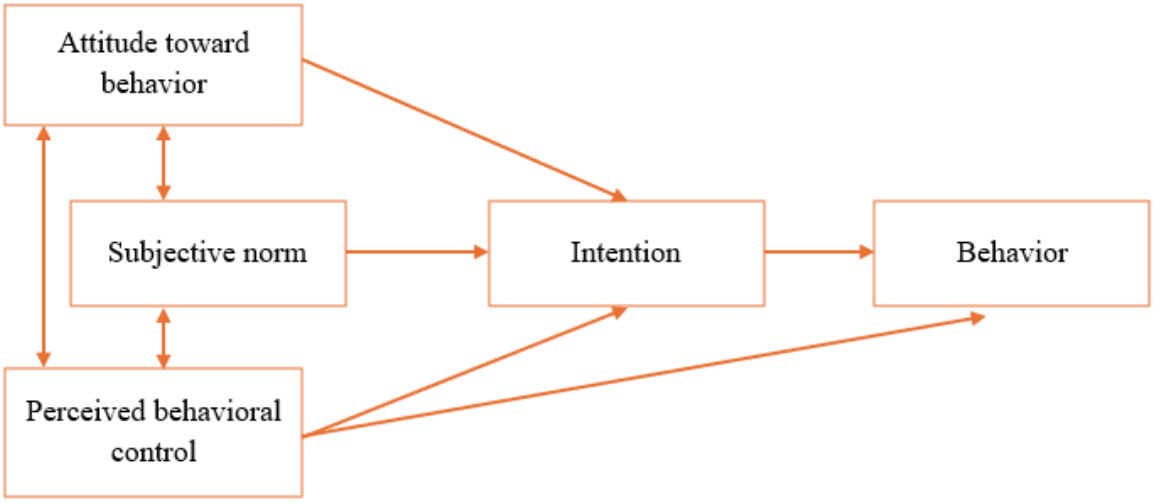

The Theory of Planned Behavior, an extension of the Theory of Reasoned Action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975), addresses the limitations of the original model in dealing with behaviors where individuals have incomplete volitional control.

Icek Ajzen (1991) asserts that TPB provides a comprehensive framework for understanding human social behavior, incorporating central concepts from the social and behavioral sciences. It highlights attitudes toward behavior, subjective norms, and perceived behavioral control as key predictors of behavioral intentions, significantly influencing behavior. Despite uncertainties regarding the nature of the relationships between beliefs about behavior and attitudes, TPB application to specific domains offers valuable insights for understanding behaviors and designing effective interventions. Intention, perception of behavioral control, attitude, and subjective norm each provide unique perspectives on behavior, with beliefs offering detailed descriptions of behavior determinants. Consequently, TPB offers a nuanced understanding of behavior and serves as a valuable framework for implementing interventions aimed at behavior change.

In comparison with the Theory of Reasoned Action (TRA), the Theory of Planned Behavior (TPB) posits that behavioral intentions are jointly influenced by attitudes toward behavior and subjective norms. Moreover, TPB posits that perceived behavioral control also plays a significant role in influencing behavioral intention, departing from the assumption that behavior is solely influenced by external factors. Particularly in the

context of customers' perceptions of behavioral control regarding depositing money, individuals assess the financial benefits associated with the service and their perceived ability to attain high interest income. These factors contribute to their intention to deposit money and, conversely, influence their decision-making process regarding deposit behavior.

Figure 2.2: Theory of Planned Behavior – TPB (Ajzen, 1991).

2.3. Factors affecting individual customers' decision to deposit money in banks

2.3.1. Literature review of research on customers' decisions and behavior with bank deposit

2.3.1.1. International studies

Globally, research on customers' decisions regarding bank deposits remains relatively sparse. One notable study investigated the factors influencing clients' decisions to engage in bank deposits at Ziraat Bank BH, employing a sample of 100 respondents. Velid Efendić et al. (2020) identified a significant relationship between the status of time deposits and the interest rate, with 91% of respondents considering high interest rates a crucial factor in their selection of a deposit bank.

Furthermore, research by Keria Kontot et al. (2016) explored the factors influencing customers' preferences for deposit products in Islamic banks. Their findings indicated that returns, confidence and trust, security, transparency, and the flexibility of withdrawal schemes are key determinants in customers' decision-making processes. These factors collectively shape customers' preferences when selecting deposit products at Islamic banks.

2.3.1.2. Domestic studies

Research on the factors influencing customers' decisions regarding savings deposits has become increasingly prevalent in Vietnam, employing a wide range of research methodologies.

Giang and Phan Thi Huong (2023) identified six key factors explaining 64.780% of the variance in customers' decisions, listed in descending order of influence: Bank Brand, Safety, Image of Staff, Customer Policies, Interest Rate Policies, and Transaction Time. This study utilized convenience sampling and included a quantitative research sample of 239 individual customers currently depositing savings at Vietinbank Ba Ria – Vung Tau. Similarly, research conducted by Nguyen Ngoc Duy Phuong and Vu Thi Huong (2018) confirmed the presence of five factors affecting individual customers' decisions to deposit savings at Vietinbank in Lam Dong province. The study highlighted that Bank Brand exerts the strongest influence on customers' decisions. Other significant factors identified include Influence from the relationship, Financial Benefits, Transaction Time and Safety, and Marketing.

In a research study conducted at SCB Tra Vinh, author Le Trung Hieu et al. identified several factors influencing individual customers' decisions to deposit savings at the branch. These factors, identified through a sample of 210 customers, encompass Marketing, Interest Rate Policies, Bank Brand, and Customer Service. In addition, a 2021 study involving 200 individual customers with savings at VIB, conducted by authors Ngo Thi Nga and Hoang Long Thinh, five influential factors were discerned: Safety, Convenience, Customer Service, Financial Benefit, and Relative Influencers. Moreover, research conducted at Agribank O Mon Branch in Can Tho City, by authors Pham Dang Thuy Linh and Nguyen Quoc Nghi (2021), with a sample size of 155 customers, emphasized Safety, Financial Benefit, Bank Brand, Staff, Service, and Convenience as pivotal factors influencing decisions regarding savings deposits.

In a comprehensive study conducted by authors Bui Nhat Vuong et al. (2020), titled "Factors Affecting Savings Deposit Decision of Individual Customers: Empirical Evidence from Vietnamese Commercial Banks," the research focused on a sample of 403 individual customers. The study identified six key components impacting the savings deposit decision of individual customers, ranked from strongest to weakest influence: the

form of promotion, bank brand, service quality, interest rate policy, and employee knowledge and attitude.

2.3.2. Factors affecting individual customers' decision to deposit money in banks

2.3.2.1. Individual customers' decision on deposits (dependent variable)

According to the TRA and TPB, the dependent variable "Individual customers' decision on deposits" refers to the behavioral outcome representing whether or not individual customers choose to deposit money at the Saigon – Hanoi Commercial Joint Stock Bank. Both of these theories propose that behavior is determined by intentions, which are influenced by attitudes, subjective norms, and perceived behavioral control. In this research context, the decision to deposit money at SHB is considered the behavioral intention of individual customers. Their intentions are determined by their attitudes toward depositing money at SHB as perceived benefits of banking with SHB, subjective norms as norms related to banking choices, and perceived behavioral control as perceived ease or difficulty of depositing money at SHB. The dependent variable, "Individual customers' decision on deposits," captures the manifestation of these intentions into actual behaviors, reflecting the extent to which customers follow through with depositing money at SHB. By analyzing this dependent variable within the framework of TRA and TPB, the research aims to identify the key factors influencing customers' intentions and subsequent behaviors regarding depositing money at SHB.

2.3.2.2. Deposit interest rates

The deposit interest rate is the percentage of interest that a bank pays on the amount of money deposited by customers in various types of accounts, such as savings accounts, term deposits, and certificates of deposit. This rate is one of the key factors for customers when deciding where to place their funds, as it determines the return they will earn on their deposits over time (Nguyen Ngoc Duy Phuong et al., 2018; Bui Nhat Vuong et al., 2020; Pham Dang Thuy Linh et al., 2021; Duong Thi Thao et al., 2021). Furthermore, apart from ensuring the coverage of all operational expenditures, it is imperative that bank interest rates reflect the supply-demand dynamics of currency in the market while closely tracking fluctuations in inflation rates and maintaining market competitiveness (Bui Nhat Vuong et al., 2020).

According to Giang and Phan Thi Huong (2023), the deposit interest rate should be sufficiently appealing to effectively compete with alternative investment opportunities available to currency investors in sectors presenting comparable levels of risk. Higher deposit interest rates could attract more customers and raise the money supply available to commercial banks. Therefore, commercial banks believe that the most important thing for maintaining and increasing deposit balances is the implementation of a flexible deposit interest rate policy within the context of free market competition.

2.3.2.3. Bank Brand

A bank's brand includes its reputation, trustworthiness, and level of confidence among customers. According to Mokhlis et al. (2008), a bank's brand significantly influences individuals' decisions to deposit money. Depositors commonly favor well-established banks over newly founded ones and tend to prefer larger banks over smaller ones. This preference is due to the perception that established banks are more trustworthy and reliable. Consequently, a bank with a strong and esteemed brand enjoys a competitive advantage in securing capital over an extended period (Bui Nhat Vuong et al., 2020). Furthermore, the strength of a bank's brand is positively correlated with the level of trust it instills in customers, especially those seeking savings services. This trust fosters enduring transactional relationships between customers and the bank (Le Quang Khoi et al., 2022).

2.3.2.4. Bank staff (employee quality)

In the banking industry, the term "employee quality" refers to how bank staff act and present themselves, including their friendliness, dedication, responsiveness to customers' demands, and service style. According to Kamakodi and Khan (2008), the service quality provided by bank employees significantly influences the bank's image. Since customers' interactions primarily occur with bank tellers, their attitudes and work styles are pivotal in shaping the bank's reputation. Currently, with a variety of domestic and foreign banks offering comparable technological products, the competitive edge of banks hinges largely on the quality of service provided by their staff (Pham Duc Trung et al., 2020).

Giang and Phan Thi Huong (2023) emphasize the role of employee expertise, professionalism, agility, communication skills, and ethical conduct in satisfying

customers and attracting savings deposits. Conversely, a lack of a commendable, standardized, and professional service ethos can lead to customer attrition, resulting in adverse implications for the bank's operations, particularly in the capital mobilization process (Bui Nhat Vuong et al., 2020).

2.3.2.5. Safety

When selecting an investment channel, individuals and households consistently factor in risk as a crucial consideration, thereby prompting them to opt for banks in which they have unwavering trust (Ngo Thi Nga et al., 2021). Transactions conducted at banks are inherently sensitive, directly involving customers' financial assets, thereby underscoring the significance of ensuring a sense of safety. As highlighted by Mokhlis et al. (2008), this sense of safety embodies customers' quest for stability and security when engaging in financial transactions with banking services. It encompasses both the internal safety measures within the bank and the financial stability of the institution itself. Banks have effectively investigated, participated in, and executed the best strategies after realizing that safety and security are essential components of service quality and thus they should ultimately be given priority (Giang, Phan Thi Huong, 2023). Deposit safety emerges as a decisive factor influencing the choice of a bank (Mokhlis et al.,2011).

2.3.2.6. Convenience

The convenience of transactions stands as another influential factor impacting individual customers' decision-making processes. This convenience encompasses factors such as location, timing, and ease of transactions between the bank and its customers (Pham Dang Thuy Linh et al., 2021). The ease of transactions is manifested through the bank's network of branches, the accessibility of transaction points, the variety of savings deposit options, and streamlined transaction procedures. A bank equipped with robust technical infrastructure, modern amenities, and conveniently located and secure transaction facilities instills a sense of security among customers when depositing funds, laying the groundwork for swift and efficient service delivery (Bui Nhat Vuong et al., 2020).

2.3.2.7. Marketing

Marketing plays a pivotal role in shaping customers' decisions regarding their deposits, exerting a direct influence on their choices. Customers are drawn to banks and

products that they perceive favorably, often attracted by compelling advertising campaigns and promotional efforts. Consequently, customers tend to prioritize bank brands they identify with positively over competing options (Bui Nhat Vuong et al., 2020). In response, banks continuously launch diverse and appealing promotions across various channels, including television, social media, and banners, aiming to attract customers. Thus, it is imperative for banks to consistently develop suitable marketing strategies to retain their existing customer base and attract new ones (Woldemariam, 2011).

CHAPTER 3: RESEARCH DESIGN

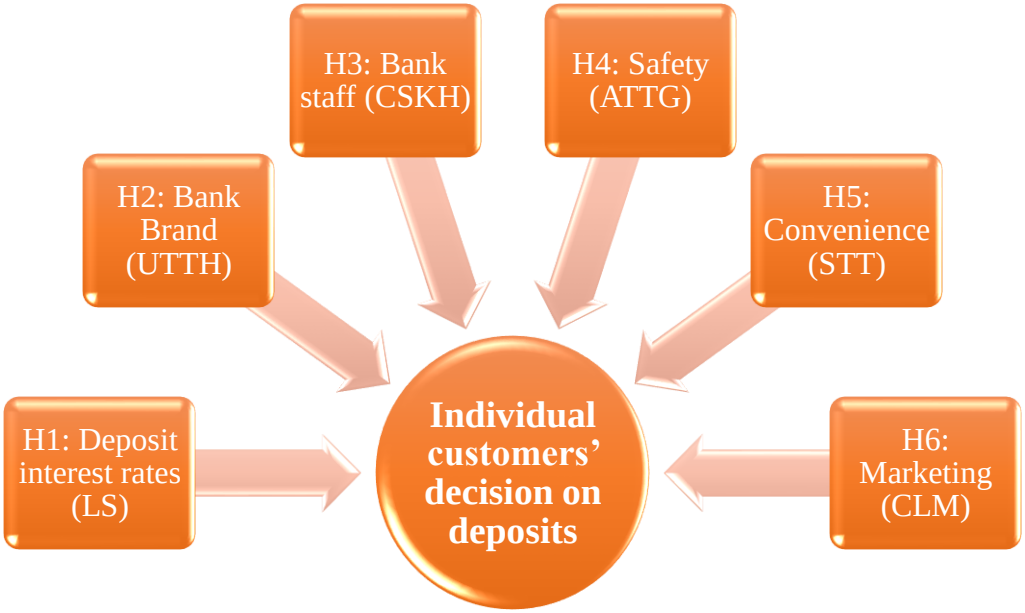

3.1. Research model

3.1.1. Research model

In this research, survey analysis was conducted utilizing Multiple Regression models, a statistical technique that relates more than two variables to each other, aligning with commonly applied methods (J. D. Jobson, 1991). This model facilitates the examination of the relationship between the dependent variable (customers' decision to deposit money) and several independent variables (factors influencing this decision). The research aims to quantify the impact of various factors on the decision to deposit money, which aligns with the capabilities of regression analysis due to its quantitative nature. Bui Nhat Vuong et al. (2020) utilized multiple regression analysis via SPSS software to identify the main factors affecting the decisions of individual customers to make savings deposits in Vietnamese commercial banks, based on a sample of 403 respondents. Additionally, multiple linear regression (MLR) models have been widely employed in previous research to analyze the influence of various factors on customers' decisions in the banking sector. This study is based on previous studies to determine factors.

From the research overview, the proposed research model is as follow:

Figure 3.1: Research model.

(Source: Author compilation)

3.1.2. Research hypothesis

3.1.2.1. Deposit interest rates (LS)

Hypothesis H_1: Deposit interest rates positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.1.2.2. Bank Brand (UTTH)

Hypothesis H_2: Bank Brand positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.1.2.3. Bank staff (CSKH)

Hypothesis H_3: Bank staff positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.1.2.4. Safety (ATTG)

Hypothesis H_4: Safety positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.1.2.5. Convenience (STT)

Hypothesis H_5: Convenience positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.1.2.6. Marketing (CLM)

Hypothesis H_6: Marketing positively affect the individual customers' decisions on deposits at Saigon - Hanoi Commercial Joint Stock Bank.

3.2. Questionnaire design

After synthesizing previous research on the factors influencing individual customers' deposit decisions in both foreign countries and Vietnam, this thesis will analyze six factors related to customers' decisions: deposit interest rate, bank brand, bank staff, safety, convenience, and marketing.

The questionnaire is structured into two parts:

Part One: This section gathers general information, including questions to determine respondent characteristics such as gender, age, education level, duration of using deposits, occupation, income, and place of residence.

Part Two: This section contains questions based on the research model. For each factor, a series of questions are designed to capture customers' opinions and evaluate the quality of SHB's deposit services.

The study's observed variables, evaluated using a five-level Likert scale, are detailed in the accompanying table. The table indicates six groups of prospective scales (26 observed variables) used to evaluate customer decisions regarding SHB's deposit services, in addition to one scale comprising four factors reflecting customer decisions.

Table 3.1: Factors encoding.

Number	Factor	Encryption
1	Deposit interest rates	LS
2	Bank brand	UTTH
3	Bank staff	CSKH
4	Safety	ATTG
5	Convenience	STT
6	Marketing	CLM
7	Customers' decisions	QDLC

(Source: Inherited from the literature review and additionally edited from previous authors' researches)

These components are designed to comprehensively assess the factors influencing customers' decisions to deposit with SHB.

Table 3.2: Scale of factors affecting individual customers' decision to deposit money at Saigon – Hanoi Commercial Joint Stock Bank.

Number	Code	Factor
I. Deposit interest rates (LS)		
1	LS1	SHB has transparently announced interest rates for individual customer deposits.
2	LS2	SHB has preferential interest rates for priority customers.

3	LS3	SHB's individual deposit interest rates are competitive.
4	LS4	SHB always provide clients an in-depth explanation of interest rates and how to compute interest.
II. Bank brand (UTTH)		
1	UTTH1	SHB has a high level of recognition.
2	UTTH2	SHB has a well-established reputation.
3	UTTH3	SHB is an established financial institution with a longstanding presence in Vietnam.
4	UTTH4	SHB has been widely recognized with numerous prestigious awards for its products and services for individual customers.
III. Bank staff (CSKH)		
1	CSKH1	The service manner of SHB team is impressive and professional.
2	CSKH2	SHB always responds rapidly to customer inquiries andgrievances
3	CSKH3	Staff of the bank handle transactions quickly and accurately.
4	CSKH4	Staff at SHB consistently provides comprehensive guidance on products and customer support channels.
IV. Safety (ATTG)		
1	ATTG1	Customer information security is a top priority for SHB.
2	ATTG2	SHB consistently offers thorough guidance to customers regarding measures ensuring the safety of their deposits..
3	ATTG3	SHB offers a multitude of channels to offer support, guidance, and disseminate information aimed at ensuring the safety of customer deposits.
4	ATTG4	SHB consistently ensures the effective resolution of risks associated with individual customer deposits, thereby safeguarding the rights of its clientele.
V. Convenience (STT)		
1	STT1	SHB has simple and accessible deposit procedures.

2	STT2	SHB has rapid transaction procedures.
3	STT3	SHB has an extensive transaction network.
4	STT4	SHB provides convenient and user-friendly online transaction services.
5	STT5	SHB consistently offers prompt and comprehensive support for all customer transactions.
VI. Marketing (CLM)		
1	CLM1	SHB offers a wide range of products appropriate for various consumer segments and purposes.
2	CLM2	Advertising and introduction of SHB's deposit products for individual customers are very impressive and attractive.
3	CLM3	SHB staff always introduce new deposit products to customers.
4	CLM4	Information pertaining to individual deposits is readily accessible to customers through various channels including transaction counters, digital banking platforms, and the bank's official website.
5	CLM5	SHB regularly participates in social activities to enhance brand visibility.
VII. Customers' decisions (QDLC)		
1	QDLC1	You are satisfied with the quality of deposit services at Saigon - Hanoi Commercial Joint Stock Bank (SHB).
2	QDLC2	You are willing to introduce your acquaintances to use SHB's deposit service
3	QDLC3	You will continue to use SHB's deposit service in the future.
4	QDLC4	SHB is the top choice when depositing money.

(Source: Inherited from the literature review and additionally edited from previous authors' researches)

3.3. Research sample

The minimal sample size to employ exploratory factor analysis (EFA) is 50, generally 100 or more, according to Hair et al. (2009, 2010). The minimum sample size for best analytical use is 5:1 (Hair et al.). Furthermore, according to a theory based on the rate of change of the reliability standards relative to n, the formula, n = 20 + 5*k (k = number of independent variables), is optimal (H. Khamis et al., 2010). Therefore, the

sample size for this study was n = 250, and the survey sample was chosen at random from the users who transacted at Saigon - Hanoi Commercial Joint Stock Bank.

Table 3.3: Research samples

		Frequency	**Valid Percent (%)**
Sex	Male	82	41.0
	Female	118	59.0
	Total	200	100.0
Age	16-30	63	31.5
	31-45	74	37.0
	46-60	49	24.5
	Over 60	14	7.0
	Total	200	100.0
Education level	Undergraduated from high school	3	1.5
	High school	16	8.0
	Intermediate college	54	27.0
	Bachelor's degree	98	49.0
	Postgraduate	29	14.5
	Total	200	100.0
Occupation	Student	15	7.5
	Officer	88	44.0
	Businessmen/ women	28	14.0
	Freelancer	25	12.5

	Retirement	15	7.5
	Others	29	14.5

- Research samples collected by random use
- Number of surveys issued: 250
- Number of surveys collected: 225
- Valid surveys: 200
- Invalid surveys: 25

3.4. Data analysis

3.4.1. Primary data

This dissertation gathers primary data through surveys to evaluate individual customers' decisions regarding deposits. Each respondent receives a questionnaire, and they use Google Forms to fill it up based on their own experiences using SHB's deposit

services. This methodology is designed to ensure the collection of accurate data and to meet the research objectives. There were no conflicts of interest in the selection of subjects and respondents for the study. The data collected from the questionnaires will be utilized for quantitative analysis, using SPSS software version 23.

3.4.2. Secondary data

3.4.2.1. Cronbach''s Alpha Analysis

Alpha, first introduced by Lee Cronbach in 1951, measures the internal consistency of a test or scale, with values ranging from 0 to 1 (Balkishan Sharma, 2016). Cronbach's Alpha is applicable to both binary-type and large-scale data. Factors influencing the value of alpha include the number of test items, item interrelatedness, and dimensionality (Jose M. Cortina, 1993). A low alpha value can result from a small number of questions or low correlations among item pairs, indicating that some items may need to be removed. Conversely, an excessively high alpha value, approaching 1, may suggest redundancy, as some items might be testing the same construct in different ways. A maximum alpha value of 0.90 is recommended to avoid such redundancy (Balkishan Sharma, 2016).

3.4.2.2. Exploratory factor analysis (EFA)

In quantitative research, Exploratory Factor Analysis (EFA) stands as a prominent method employed to ascertain the inherent common structure among a set of observed variables (Hair et al., 2014). Exploratory factor analysis (EFA) is used to combine a set of several dependently correlated variables into a group of factors after evaluating the reliability of the Cronbach's alpha scale and eliminating variables that do not assure reliability (Hair et al. 2009). The following evaluation criteria were applied to the study:

The Kaiser-Meyer-Olkin (KMO) coefficient is an index used to evaluate if factor analysis is suitable. For factor analysis to be appropriate, the value of KMO must attain a value of $\mathbf{0.5 \leq KMO \leq 1}$.

To determine if the observed variables in the factor are correlated with one another or not, Bartlett's test of sphericity is used. It should be emphasized that the observed variables indicating various aspects of the same component must be correlated with one another in order to use factor analysis. Therefore, factor analysis should not be applied to the variables under investigation if the test demonstrates no statistical significance.

Bartlett's Test shows that observed variables are associated with one another in the component and also has statistical significance (sig Bartlett's Test < 0.05).

To determine how many components should be evaluated in an exploratory factor analysis, the eigenvalue is a frequently utilized statistic. Only factors with an Eigenvalue ≥ 1 are preserved in the analytical model using this test.

Total Variance Explained ≥ 50% shows that the EFA model is suitable.

Factor loading ≥ 0.5 is a measurement of how closely the observed variable and the factor correlate. A higher factor loading coefficient indicates a more pronounced correlation between the observed variable and the factor.

3.4.2.3. Pearson Analysis

"The Pearson correlation coefficient is a descriptive statistic, playing a pivotal role in elucidating the features of a dataset by quantifying the strength and direction of the linear relationship between two quantitative variables" (Nafis Faizi, Yasir Alvi, 2023; Turney, 2024). This coefficient offers valuable insights into the degree to which changes in one variable correspond to changes in another, thereby facilitating the comprehension of their interdependency.

The values for the Pearson correlation coefficient (r) range from -1 to 1:

- If r moves closer to 1 or -1, the linear correlation is stronger and tighter. Moving towards 1 is a positive correlation; moving towards -1 is a negative correlation.
- If r approaches 0, the linear correlation becomes weaker.
- If r = 1: absolute linear correlation, when plotted on a scatter graph as shown above, the points will merge into a straight line.
- If r = 0, there is no linear correlation. At this point, two situations will occur. One, there is no relationship between the two variables. Second, there is a nonlinear relationship between them.

3.4.2.4. Linear regression analysis

Analysis of the correlation between the independent and dependent variables in equation (1): Based on the Correlations table in SPSS version 23, determine the level of correlation between two quantitative variables (if both variables are correlated, the linear regression model is appropriate). Sig (2-tailed) value test with $\alpha = 0.05$; the correlation is

stronger the closer the Pearson correlation coefficient (r) is to 1. The correlation between the variables is more discrete and independent, the closer (r) approaches 0.

Regression analysis is applied to the linear regression analysis method after evaluating the correlation between variables.

The adjusted R Square coefficient, in combination with the Sig.F Change < $\alpha = 0.05$ coefficient, is used to evaluate the model's fit.

Verify the residuals' independence (εi) by using the Durbin-Watson coefficient. The model has no residual autocorrelation if 1 < Durbin-Watson < 3.

Test the VIF coefficient for model flaws (multicollinearity issue). Multicollinearity exists in the model if the VIF coefficient is less than 10.

Analyze the residuals' normal distribution using a histogram.

Utilize Standardized Coefficients Beta to assess the positive and negative impact of factors affecting customer satisfaction on the quality of the e-banking service.

CHAPTER 4: RESULTS AND DISCUSSION

4.1. The journey of SHB's establishment and development

4.1.1. The history of SHB

Saigon - Hanoi Commercial Joint Stock Bank, originally established as Nhon Ai Rural Commercial Joint Stock Bank in Can Tho in 1993, has evolved significantly over the past three decades. In 2006, the bank rebranded and relocated its headquarters to Hanoi, subsequently listing on the Hanoi Stock Exchange in 2009. Currently, SHB had grown into one of Vietnam's top five largest commercial joint stock banks, with assets totaling VND 630 trillion and a network of 569 transaction points across nearly 50 provinces and cities domestically and internationally.

Throughout its development, SHB has progressively increased its charter capital, enhancing its operational capacity and extending its market reach. Key milestones include the establishment of branches in Cambodia and Laos in 2012, and significant technological and structural advancements in 2019 aimed at improving business management and risk control. By 2021, SHB had transferred its shares to the Ho Chi Minh City Stock Exchange and continued to modernize its banking operations and digital platforms.

In 2023, SHB reported a pre-tax profit of over VND 9,239 billion and the bank's total assets grew to VND 630,500 billion, with equity capital reaching VND 50 trillion. SHB continues to expand its market position, aiming to become the leading bank in efficiency and technology among Vietnamese commercial banks while enhancing its modern retail banking services in the region.

4.1.2. Business performance of SHB

4.1.2.1. Strengths

Saigon - Hanoi Commercial Joint Stock Bank has demonstrated significant strengths, as evidenced by its impressive performance metrics and strategic initiatives. In 2023, SHB's brand strength index (BSI) rose by 16 points to 65, making it the fastest-growing bank brand in Vietnam. The bank's brand value also surged by 31% from 2022 and 117% from 2021, securing its place among the "Top 100 Most Valuable Brands in Vietnam" and “Best Bank in Vietnam” selected by Global Finance (2022). This remarkable growth reflects SHB's efforts to ensure safe and sustainable business

operations, continuous innovation in products and services, and proactive community engagement. Total assets grew by 16.24% to VND 630 trillion, with deposits and credit balances also showing significant growth. Additionally, the bank increased its charter capital by 18% to nearly VND 36.194 billion, reinforcing its position among the top four private joint-stock commercial banks in Vietnam. The bank's strategic focus on digital transformation and information technology modernization further enhances its operational efficiency and customer experience, earning recognition from prestigious financial institutions. SHB's commitment to sustainable development, excellence in ESG impact, and talent cultivation has also garnered accolades, including "Bank with the Best Social Impact Financial Initiative" and "Vietnam's Best ESG Impact Bank." This comprehensive transformation and strategic direction, aimed at becoming the most efficient and favored digital bank, highlight SHB's formidable strengths in finance, technology, and human resources.

4.1.2.2. Weaknesses

In 2023, SHB faced several notable weaknesses in its profitability and risk management. There was a 4.65% decrease in pre-tax profit to VND 9,239 billion compared to the previous year. This decline was driven by a 15.03% increase in total operating costs, including a substantial 58.32% rise in administrative expenses and a nearly 34% increase in credit risk allowances, primarily for customer loans. The costs associated with provisioning for loan group 5 – Loss debt – rose significantly by 142% in 2022 and 35.97% in 2023. Additionally, SHB's non-performing loan ratio increased from 1.69% in 2021 to 2.81% in 2022, and further to 3.02% in 2023, failing to meet the targeted NPL ratio of less than 2%. These factors reflect challenges in SHB's loan portfolio management, increased operational expenditures, and a higher NPL ratio compared to some competitors, which negatively impact the bank's profitability and risk profile.

4.1.2.3. Opportunities

The banking industry in Vietnam still has a lot of potential, as about 80% of the country's population currently lacks access to banking services. Moreover, as Vietnam undergoes rapid digital transformation driven by advancements in technology and artificial intelligence, SHB has the opportunity to optimize its management and

operations, develop innovative products and services, and enhance its competitive edge in the market. The government's emphasis on transitioning towards a digital economy further underscores the importance of technology in shaping the future of banking, presenting SHB with opportunities to innovate and stay competitive in the market. Additionally, Vietnam's increasing participation in free trade agreements and growing cooperation between domestic and foreign businesses offer SHB avenues for expanding its services, fostering partnerships, and capitalizing on the rising demand for financial solutions. As technology transfer and collaborations with fintech companies continue to evolve, SHB can enhance its technical capabilities and modernize its offerings to meet the diverse needs of customers, thereby establishing itself as a key player in the dynamic banking ecosystem of Vietnam.

4.1.2.4. Threats

SHB confronts several potential threats that could impact its future operations and financial stability. The projection of robust economic growth in Vietnam, as forecasted by organizations like AMRO, the World Bank, and the UN, indicates a positive outlook. However, this growth is accompanied by risks, notably the escalating credit expansion, which poses hidden dangers such as increased bad debts and the need for higher provisions. Despite challenges posed by the ongoing impacts of the economy's recovery phase, as well as uncertainty related to interest rates and currency rates, the banking industry is also facing constant pressure to increase equity capital. Furthermore, the swift growth of Fintech in the banking sector introduces substantial challenges for regulatory agencies, including concerns related to cybersecurity, personal data protection, consumer rights, and the prevention of financial crimes such as money laundering and terrorist financing. The increasing reliance on technology in banking transactions further amplifies the susceptibility of banks, including SHB, to sophisticated cyber threats, highlighting the critical importance of robust cybersecurity measures to mitigate potential risks.

4.2. Overview of individual deposit mobilization of SHB

Individual customer deposit size

Over the past four years, SHB has demonstrated a consistent upward trend in total customer deposits, rising from 301,327,326 VND million in 2020 to 444,627,843 VND million in 2023. This growth represents a substantial increase of approximately 47.56%

over the period (Appendix 8). There have been substantial variations in the proportion of total customer deposits in SHB's total liabilities. In 2020, customer deposits accounted for 78.48% of total liabilities. A large increase in other liabilities or slower deposit growth probably caused this percentage to decline to 69.89% one year later. However, it rebounded to 72.76% in 2022 and further increased to 77.22% in 2023, indicating a strong recovery and growth in customer trust or preference for SHB as a deposit institution.

Table 4.1: Individual customer deposit size from 2020 to 2023

Content	**2020**	**2021**	**2022**	**2023**
Total liabilities (VND million)	383,953,844	463,979,011	492,623,359	575,781,695
Customer deposit (VND million)	301,327,326	324,287,797	358,448,316	444,627,843
Weight of customer deposits on total liabilities (%)	78.48%	69.89%	72.76%	77.22%
Individual customer deposit (VND million)	204,605,449	206,700,813	229,402,284	312,672,820
Weight of individual customer deposits on total liabilities (%)	53.29%	44.55%	46.57%	54.30%

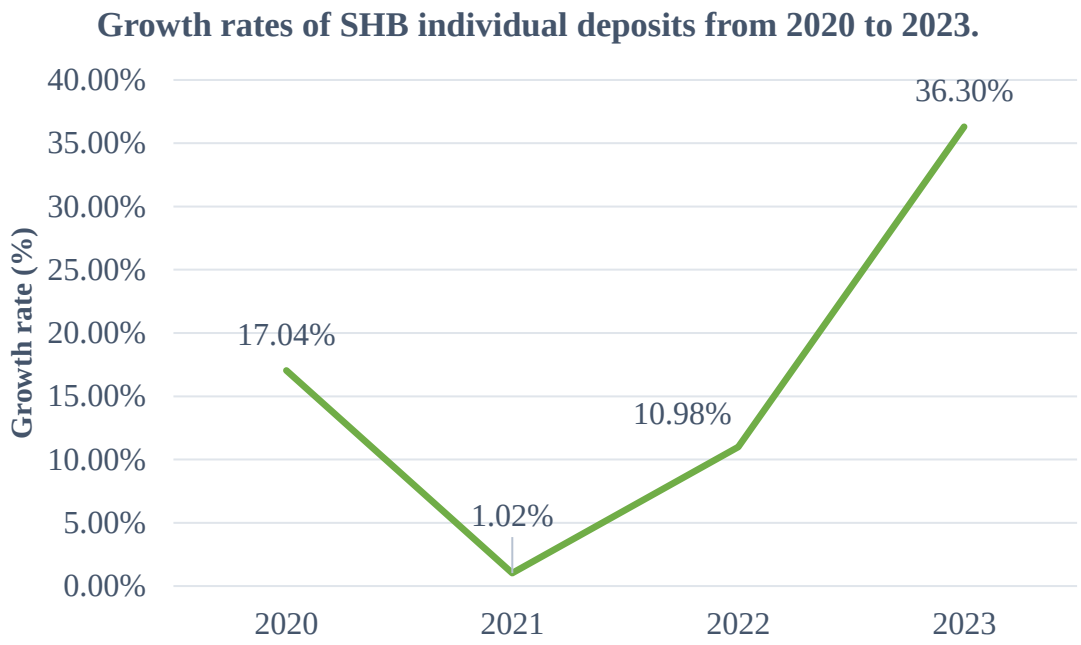

(Sources: SHB financial statements 2020 – 2023 and self-calculations)

Furthermore, individual customer deposits have consistently constituted over 40% of SHB's total liabilities, underscoring their pivotal role in the bank's operations. In 2020,

individual customer deposits comprised 53.29% of total liabilities. However, this proportion declined to over 44% two years later due to the economic instability brought on by the COVID-19 pandemic's worldwide impacts, including in Vietnam. Particularly, 2023 is a year marking the recovery of SHB, especially in the individual customer deposit mobilization segment, which accounts for 54.3% of total liabilities. These changes suggest that while there were fluctuations, SHB has managed to maintain a substantial portion of its liabilities in the form of customer deposits, typically individual customer deposits, underscoring the institution's reliance on and effectiveness in attracting deposit funds.

Growth rates of SHB individual deposits

Graph 4.1: Growth rates of SHB individual deposits from 2020 to 2023.

(Sources: SHB financial statements 2020 – 2023 and self-calculations)

Individual deposits at SHB exhibited significant growth, increasing from 204,605,449 VND million in 2020 to 312,672,820 VND million in 2023, representing an overall increase of 52.82% over the four-year period (Appendix 8). In particular, SHB experienced a substantial growth rate of 17.04% in 2020. However, in 2021, individual deposits grew by merely 1%, reflecting a significant downturn in the growth rate of individual customer deposits. This significant downturn in deposit growth can be attributed to the financial uncertainties brought about by the COVID-19 pandemic. This

uncertainty may have led individuals to prefer holding cash or gold over depositing funds in banks. The economic disruption caused by the pandemic may have led to a reduction in savings and deposits as people faced job losses and decreased incomes. In response to the economic crisis, commercial banks reduced interest rates to stimulate economic activity, thereby diminishing the attractiveness of savings deposits. Furthermore, during periods of economic downturn, individuals often utilize their savings to cover living expenses, leading to reduced deposit growth. The pronounced decline in deposit growth underscores the susceptibility of individual deposits to broader economic challenges.

In the subsequent year, 2022, there were indications of recovery, with the growth rate improving to nearly 11%. The most remarkable increase was observed in 2023, with the growth rate increasing to 36.3%, indicating a strong recovery and heightened attractiveness of SHB's deposit services. The upward trend observed during this period highlights the effectiveness of the bank's strategies aimed at attracting individual deposits, reinforcing its position and stability within the competitive banking sector through a policy offering competitive interest rates on deposits, and enabling online deposits to be convenient to execute. As economies began to recover from the pandemic, individuals likely increased their savings, leading to a rise in deposits. Additionally, higher inflation rates might have driven individuals to save more in secure bank deposits as a hedge against rising costs due to an increase in inflation rates.

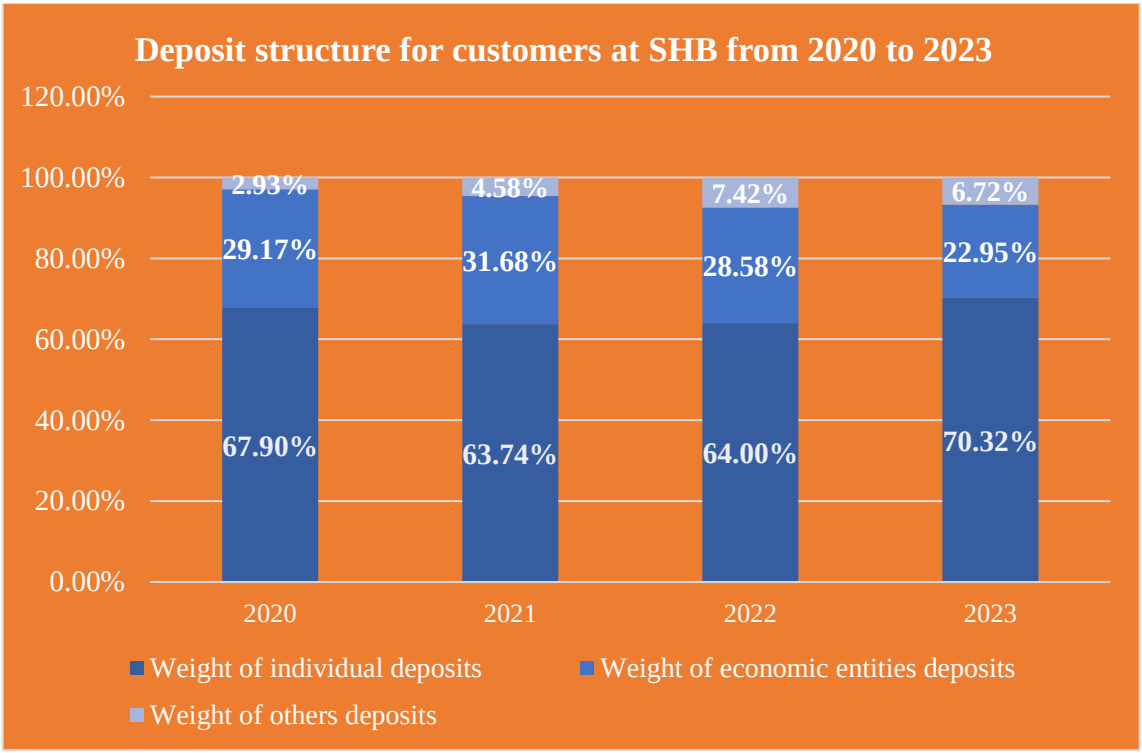

In conclusion, from 2020 to 2023, individual deposit growth rates at SHB fluctuated, indicating the dynamic interaction between the bank's objectives and the state of the economy. The influence of economic uncertainty on deposit behavior is demonstrated by the initial decrease in 2021; on the other hand, the recovery and substantial growth following in 2023 highlight the effectiveness of SHB's strategies for attracting deposits in an economic recovery.

Deposit structure for customers

In 2020, individual deposits accounted for 67.90% of SHB's funding base, reflecting a significant reliance on individual depositors. However, the leading position decreased to 63.74% one year later. In spite of the slight decrease, the proportion of individual deposits increased dramatically in 2023, reaching 70.32%, indicating a substantial recovery of confidence among individual customers in SHB's deposit services.

This trend indicates potentially intentional efforts by SHB to attract individual depositors as well as rapid shifts in individual depositor behavior. The increase in the proportion of individual customer deposits within SHB's total customer deposits underscores the bank's strategic emphasis on expanding its retail banking segment, fostering customer loyalty, and broadening its funding sources. This approach not only enhances the stability of SHB's funding sources but also signifies a commitment to engaging with retail customers. In order to strengthen its position for long-term development and resilience in the competitive banking industry, SHB places a high priority on individual deposits.

Graph 4.2: Deposit structure for customers at SHB from 2020 to 2023.

(Sources: SHB financial statements 2020 – 2023 and self-calculation)

To sum up, over the past four years, individual customer deposits at SHB have shown an unpredictable trend shaped by economic fluctuations and strategic responses. Initially, from 2020 to 2021, individual deposits experienced modest growth, hampered by the economic uncertainty induced by the COVID-19 pandemic, which reduced depositors' confidence and resulted in slower growth rates. However, from 2022 onwards, SHB implemented effective strategies such as competitive interest rates and enhanced digital banking services for deposits, leading to a remarkable recovery in deposit growth. By 2023, individual deposits not only rebounded but surged significantly, marking a

36.3% growth rate, showcasing renewed confidence and preference among customers for SHB's deposit services. This recovery underscored SHB's resilience and adaptability in dealing with economic challenges while reinforcing its strategic focus on expanding its retail banking segment and fostering customer loyalty. The consistent increase in the proportion of individual deposits within SHB's funding sources further highlights the bank's successful efforts to strengthen its position in the competitive banking industry through customer-centric initiatives and robust deposit mobilization strategies.

4.3. Analyzing the factors affecting individual customers' decision to deposit money at Saigon – Hanoi Commercial Joint Stock Bank

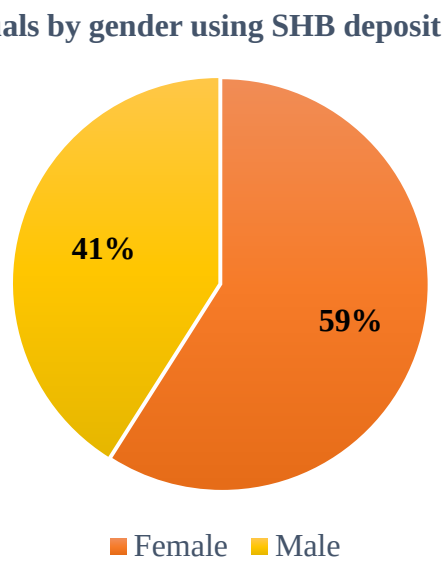

4.3.1. Descriptive statistics

4.3.1.1. Descriptive statistics on independent qualitative variables

225 questionnaires were sent to individuals who used SHB's deposit service. In this study, 200 responses were received and verified valuable.

Sex

Graph 4.3: Individuals by gender using SHB deposit services

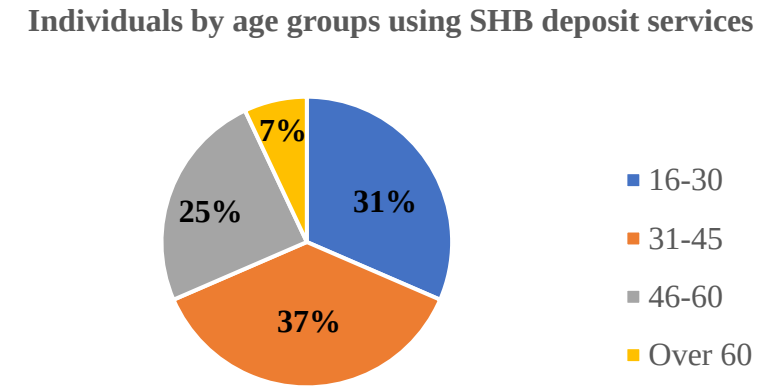

(Sources: Survey results)

There are 82 male and 118 female respondents, representing 41% and 59% of the total number of participants, respectively. Through this study, it was observed that more women than men used SHB's deposit service.

Age

Graph 4.4: Individuals by age groups using SHB deposit services

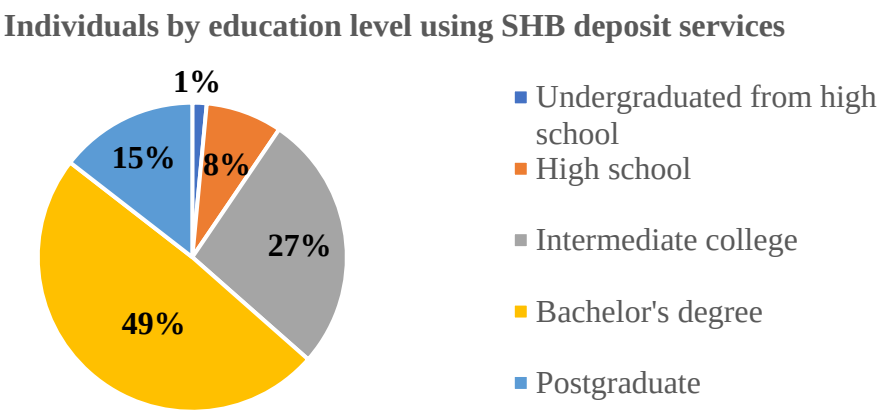

(Sources: Survey results)

The majority of respondents were under 45 years old as 31.5% of the 200 responders were under the age of thirty. There are 74 individuals in the age group of 31 to 45, making up 37% of the total respondents, and 24.5% of the population aged 46 to 60. The percentage of those over 60 who use SHB deposit services is just 7%. The primary motivation for the habit of utilizing deposit services through all age groups, even younger individuals with smaller bank balances, is the desire to save for the future while earning money on idle money.

Education level

Graph 4.5: Individuals by education level using SHB deposit services

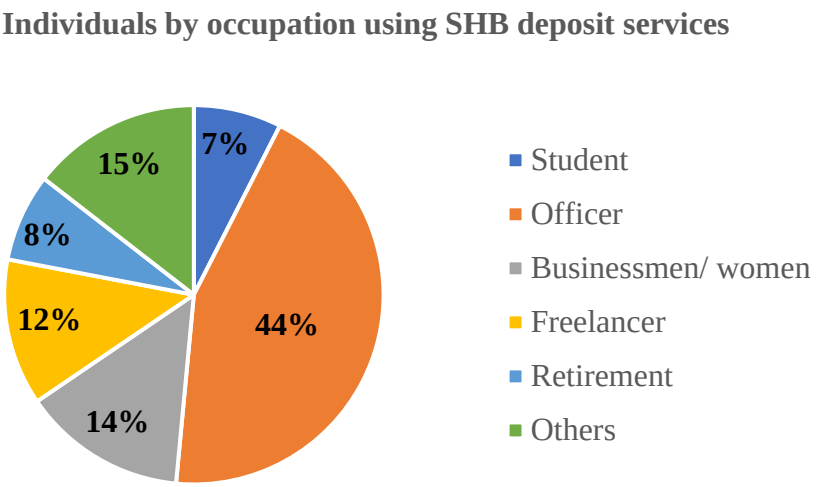

(Sources: Survey results)

The educational attainment of the surveyed population indicates a high level of academic achievement, with 49% holding a Bachelor's degree. Intermediate college graduates constitute 27%, while high school graduates represent 8%. A minority of 1.5% have not graduated from high school. This distribution underscores a strong trend towards higher education attainment among the majority of young participants.

Occupation

Graph 4.6: Individuals by occupation using SHB deposit services

(Sources: Survey results)

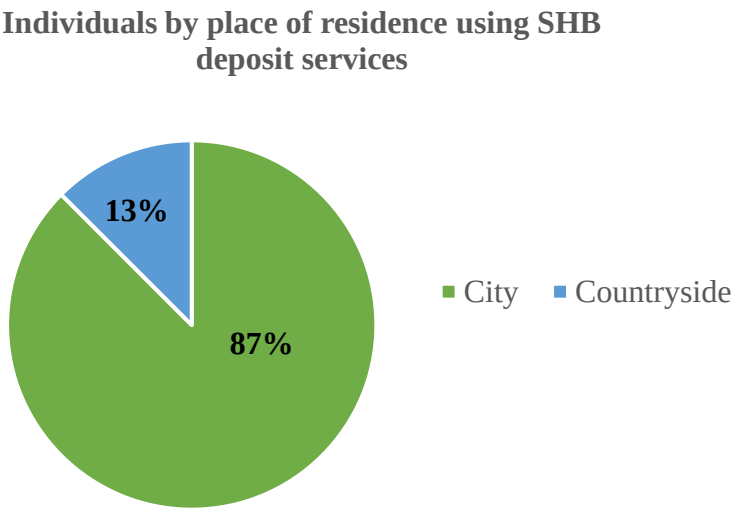

Analysis of the occupational data shows diverse employment backgrounds among the respondents. Officers constitute the largest group at 44%, indicating a significant representation of individuals in administrative or managerial roles. Businessmen or businesswomen and those in other unspecified occupations each comprise about 14% of the sample. Freelancers represent 12.5%, while students and retirees each make up 7.5%. This variety underscores a balanced representation of both employed and self-employed individuals, suggesting a broad cross-section of economic activities within the sample.

Place of Residence

The residential data indicates a strong urban predominance, with 87.5% of respondents residing in cities, while only 12.5% live in the countryside. This significant urban predominance suggests that the majority of the study participants have access to urban infrastructure and amenities, which could influence their economic activities and

lifestyle choices. The lower rural representation reflects broader demographic trends towards urbanization, which may influence the accessibility and utilization of services.

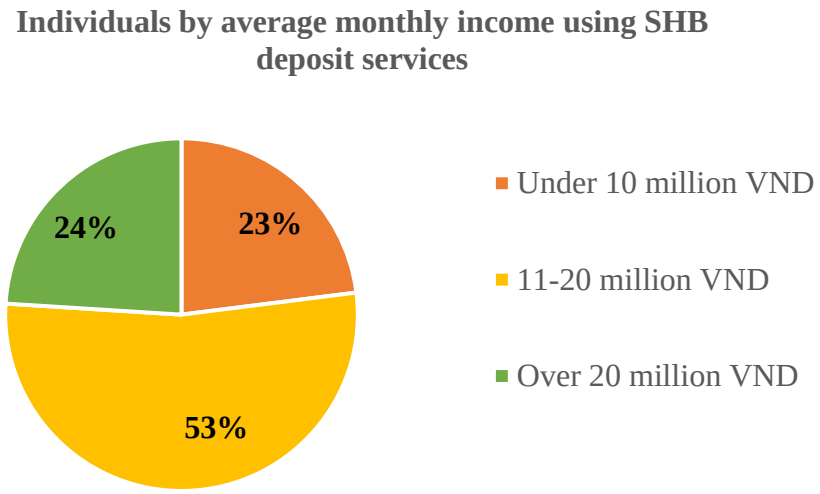

Graph 4.7: Individuals by place of residence using SHB deposit services

(Sources: Survey results)

Average monthly income

Graph 4.8: Individuals by average monthly income using SHB deposit services

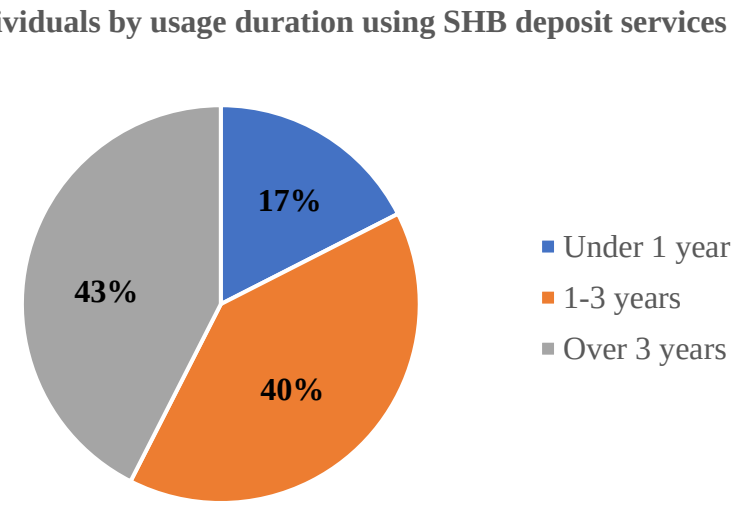

(Sources: Survey results)

The data on average monthly income indicates a varied income distribution among respondents. A majority, 53%, earn between 11 to 20 VND million, reflecting a middle-

income bracket. Additionally, 24% of respondents report incomes exceeding 20 VND million, while 23% have incomes under 10 VND million. This income distribution points to a relatively financially stable sample with a considerable portion enjoying higher earnings, which may influence their financial behavior and access to services.

Usage Duration for Deposit Services

Graph 4.9: Individuals by usage duration using SHB deposit services

(Sources: Survey results)

The analysis of deposit service usage duration indicates that a majority of respondents have longstanding relationships with their financial institutions. Specifically, 42.5% have been using deposit services for more than three years, while 40% have utilized these services for one to three years. Only 17.5% of respondents have been using deposit services for less than a year. This data suggests that most respondents have significant experience with deposit services, reflecting a stable and ongoing engagement with financial products and services.

4.3.1.2. Descriptive statistics on independent quantitative variables

The descriptive statistic data (Appendix 6) provides descriptive statistics for 26 variables collected from a sample of 200 observations, each measured on a scale ranging from 3.0 to 5.0. Analyzing the descriptive statistics for the “Deposit interest rates” factor, which comprises four observed variables, reveals mean values ranging from 3.835 to 4.16, resulting in an overall mean of 3.97875 for this factor. For the “Service quality”

factor, represented by the variables UTTH1, UTTH2, UTTH3, and UTTH4, the mean values are 3.59, 3.815, 3.745, and 3.56, respectively. The “Safety” factor, with a computed mean of 3.63525, indicates a moderate level of perceived safety among respondents. Meanwhile, the “Bank staff” factor, averaging at 3.89625, suggests a relatively high level of customer satisfaction regarding bank staff services. The mean value for the “Convenience” factor stands at 3.819, while the “Marketing” factor has a mean value of 3.679. These statistics provide valuable insights into the respondents' general perceptions of these factors, identifying areas of strength and highlighting potential areas for improvement in banking deposit services.

4.3.2. Tests

4.3.2.1. Cronbach Alpha Analysis

Based on the findings from the Cronbach’s Alpha analysis, all components within the model exhibit Cronbach’s Alpha coefficients exceeding the threshold of 0.6 (Jose M. Cortina, 1993). Moreover, the Corrected Item – Total Correlation values for the observed variables surpass 0.3, indicating their suitability for inclusion in the Exploratory Factor Analysis (EFA) procedure. These results affirm the reliability and internal consistency of the model's components, thereby validating the appropriateness of conducting EFA analysis using the observed variables.

Deposit interest rates component

Table 4.2: Reliability Statistics on Deposit interest rates component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
LS1	11.755	1.774	0.509	0.546	0.653
LS2	11.925	1.507	0.466	0.562	
LS3	11.985	1.754	0.391	0.613	
LS4	12.080	1.722	0.387	0.616	

(Sources: Author compilation from primary data with SPSS 23)

The Cronbach's Alpha coefficient for the Deposit interest rates component is measured at 0.653. Each factor within this component exhibits Corrected Item-Total Correlation values surpassing 0.3, while the overall Cronbach's Alpha coefficient remains below the 0.653 threshold. Consequently, the observed variables comprising the Deposit interest rates scale demonstrate satisfactory reliability. This outcome suggests a significant level of correlation among all four observed variables, thereby supporting the appropriateness of conducting Exploratory Factor Analysis for this component.

Bank brand component

Table 4.3: Reliability Statistics on Bank brand component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
UTTH1	11.120	1.714	0.471	0.535	0.641
UTTH2	10.895	2.115	0.353	0.617	
UTTH3	10.965	1.732	0.520	0.500	
UTTH4	11.150	1.947	0.350	0.623	

(Sources: Author compilation from primary data with SPSS 23)

The Cronbach's Alpha coefficient for the Bank brand component is measured at 0.641. Each factor within this component exhibits Corrected Item-Total Correlation values surpassing 0.3, while the overall Cronbach's Alpha coefficient remains below the 0.641 threshold. Consequently, the observed variables comprising the Bank brand scale demonstrate satisfactory reliability. This outcome suggests a significant level of correlation among all four observed variables, thereby supporting the appropriateness of conducting Exploratory Factor Analysis for this component.

Bank staff component

The Cronbach's Alpha coefficient for the Bank staff component is measured at 0.559. Factor CSKH4 within this component does not exhibit Corrected Item-Total Correlation values surpassing 0.3. Consequently, the observed variables comprising the

Bank staff scale demonstrate unsatisfactory reliability. This outcome suggests a poor level of correlation among all four observed variables, thereby abandoning the appropriateness of conducting Exploratory Factor Analysis for this component.

Table 4.4: Reliability Statistics on Bank staff component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
CSKH1	11.655	1.875	0.468	0.394	0.559
CSKH2	11.840	2.035	0.350	0.484	
CSKH3	11.56	1.685	0.445	0.393	
CSKH4	11.700	2.090	0.161	0.649	

(Sources: Author compilation from primary data with SPSS 23)

Safety component

Table 4.5: Reliability Statistics on Safety component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
ATTG1	10.760	1.470	0.378	0.420	0.537
ATTG2	10.845	1.448	0.345	0.447	
ATTG3	11.065	1.559	0.316	0.472	
ATTG4	10.965	1.521	0.263	0.521	

(Sources: Author compilation from primary data with SPSS 23)

The Cronbach's Alpha coefficient for the Safety component is measured at 0.537. Factor ATTG4 within this component does not exhibit Corrected Item-Total Correlation values surpassing 0.3. Consequently, the observed variables comprising the Safety scale demonstrate unsatisfactory reliability. This outcome suggests a poor level of correlation

among all four observed variables, thereby abandoning the appropriateness of conducting Exploratory Factor Analysis for this component.

Convenience component

Table 4.6: Reliability Statistics on Convenience component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
STT1	15.055	2.163	0.430	0.360	0.514
STT2	15.050	2.530	0.180	0.525	
STT3	15.300	2.392	0.261	0.473	
STT4	15.520	2.623	0.180	0.519	
STT5	15.455	2.289	0.390	0.392	

(Sources: Author compilation from primary data with SPSS 23)

The Cronbach's Alpha coefficient for the Convenience component is measured at 0.514. Some factors within this component do not exhibit Corrected Item-Total Correlation values surpassing 0.3. Consequently, the observed variables comprising the Convenience scale demonstrate unsatisfactory reliability. This outcome suggests a poor level of correlation among all four observed variables, thereby abandoning the appropriateness of conducting Exploratory Factor Analysis for this component.

Marketing component

The Cronbach's Alpha coefficient for the Marketing component is measured at 0.696. Each factor within this component exhibits Corrected Item-Total Correlation values surpassing 0.3, while the overall Cronbach's Alpha coefficient remains below the 0.696 threshold. Consequently, the observed variables comprising the Marketing scale demonstrate satisfactory reliability. This outcome suggests a significant level of correlation among all four observed variables, thereby supporting the appropriateness of conducting Exploratory Factor Analysis for this component.

Table 4.7: Reliability Statistics on Marketing component

Item-Total Statistics					
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cronbach's Alpha
CLM1	14.560	3.001	0.492	0.630	0.696
CLM2	14.895	3.160	0.415	0.662	
CLM3	14.685	3.111	0.445	0.649	
CLM4	14.785	3.205	0.425	0.658	
CLM5	14.655	2.780	0.484	0.634	

(Sources: Author compilation from primary data with SPSS 23)

Based on the results of the Cronbach's Alpha reliability test conducted for the variable scales, three groups of factors, including Bank Staff (CSKH), Safety (ATTG), and Convenience (STT), were eliminated due to insufficient reliability. In contrast, three groups of factors were identified as having a significant influence on individual customers' decisions regarding deposit money: Deposit Interest Rates (LS), Bank Brand (UTTH), and Marketing (CLM). These findings underscore the importance of focusing on the reliability and relevance of specific factors that impact customer behavior in the context of banking deposit services.

4.3.2.2. Exploratory factor analysis (EFA)

4.3.2.2.1. Results of running tests for independent variables

KMO and Bartlett's Test

The table gives the results of KMO and Barlett's Test for three independent variables. KMO coefficient = 0.773 meets the condition of $0.5 \leq KMO \leq 1$, which can confirm the appropriate factors. Moreover, Sig Barlett's Test = 0.000 < 0.05 proves that the observed variables in the factors are correlated with each other.

Based on the obtained results, the researcher rejects the null hypothesis (H_0), which posits that the observed variables are not correlated within the population. Consequently, the hypothesis asserting that the correlation matrix between the variables is homogeneous

is also rejected. This leads to the conclusion that the variables exhibit correlations with each other during the process of Exploratory Factor Analysis (EFA), thus satisfying the requisite conditions for factor analysis.

Table 4.8: KMO and Barlett's Test for independent variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.773
Bartlett's Test of Sphericity	Approx. Chi-Square	551.667
	df	55
	Sig.	0.000

(Sources: Author compilation from primary data with SPSS 23)

Rotated Component Matrix

During the execution of KMO and Bartlett's Test for the independent variables, the researcher conducted three iterations, resulting in the elimination of two observed variables, UTTH2 and UTTH4, due to errors encountered in the Rotated Component Matrix.

Variable UTTH2 exhibited loading factors on both Component 1 and Component 2, with values of 0.410 and 0.476, respectively (Appendix 3). The difference in loading factors between the two components was calculated as 0.476 - 0.410 = 0.066. Similarly, UTTH4 displayed loading factors on both Component 1 and Component 2, with values of 0.546 and 0.433, respectively (Appendix 4). The difference in loading factors between these components amounted to 0.546 - 0.433 = 0.113.

The rotated matrix results table indicates that among the 11 observed variables across three factors, the majority exhibit factor loading coefficients exceeding 0.5. In particular, only variable LS3 demonstrates a factor loading coefficient of 0.403, which falls below the threshold of 0.5. Consequently, it is observed that most observed variables display a significant correlation with their respective factors.

Table 4.9: Results of testing the rotation matrix for independent variables

Rotated Component Matrix[a]			
	Component		
	1	2	3
CLM2	0.784		
CLM4	0.776		
UTTH1	0.699		
UTTH3	0.642		
CLM1		0.848	
CLM3		0.758	
CLM5		0.606	
LS1			0.829
LS4			0.681
LS2			0.637
LS3			0.403

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 5 iterations.

(Sources: Author compilation from primary data with SPSS 23)

Total Variance Explained

With this criterion, only factors with Eigenvalue > 1 will be retained in the analytical model. According to the results table, the total Eigenvalue = 1.108 > 1, so three factors meet the requirements and are retained in the model.

Total Variance Explained ≥ 50% shows that the EFA model is appropriate. Considering the variation as 100%, this value represents how much of the extracted factors are condensed and how much of the observed variables are lost. The total variance extracted by these threee factors is 57.349% > 50%, thus, the three extracted factors explain 57.349% of the data variation of the 11 observed variables participating in EFA.

Table 4.10: Synthesize data from extracted variance for independent variables

Total Variance Explained									
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	3.668	33.344	33.344	3.668	33.344	33.344	2.314	21.037	21.037
2	1.532	13.929	47.273	1.532	13.929	47.273	2.092	19.015	40.053
3	1.108	10.076	57.349	1.108	10.076	57.349	1.903	17.296	57.349

Extraction Method: Principal Component Analysis.

(Sources: Author compilation from primary data with SPSS 23)

4.3.2.2.2. Results of running tests for dependent variables

KMO and Bartlett's Test

Table 4.11: KMO and Barlett's Test for dependent variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.587
Bartlett's Test of Sphericity	Approx. Chi-Square	66.031
	df	6
	Sig.	0.000

(Sources: Author compilation from primary data with SPSS 23)

The Kaiser-Meyer-Olkin (KMO) coefficient is recorded as 0.587, meeting the criterion of $0.5 \leq KMO \leq 1$, thereby indicating a satisfactory level of consistency between the dependent factor and the research data. Additionally, the significance value obtained from Bartlett's Test is noted as 0.000, which is less than the predetermined significance level of 0.05. This result suggests that the observations pertaining to the dependent factor exhibit significant correlation amongst themselves.

Rotated Component Matrix

Table 4.12: Results of testing the rotation matrix for dependent variables

Rotated Component Matrix[a]		
	Component	
	1	2
QDLC1	0.831	
QDLC3	0.818	
QDLC4		0.839
QDLC2		0.764

(Sources: Author compilation from primary data with SPSS 23)

The loading coefficients of the four observed variables for the factor have loading coefficients greater than 0.5 or even 0.7, so the correlation between the observed variables and the factor is high.

Total Variance Explained

Table 4.13: Synthesize data from extracted variance for dependent variables

Total Variance Explained									
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	1.677	41.93	41.93	1.677	41.93	41.93	1.401	35.036	35.036
2	1.035	25.884	67.814	1.035	25.884	67.814	1.311	32.778	67.814
3	0.695	17.373	85.187						
4	0.593	14.813	100						

Extraction Method: Principal Component Analysis.

(Sources: Author compilation from primary data with SPSS 23)

The table of total variance explained for the dependent variable shows that the total Eigenvalue = 1.035 > 1, total variance extracted = 67.814% > 50%, so the model meets the standard. Consequently, no factor modified following the performance of EFA based

on the observed variables. As a result, the original research model and research assumptions remain consistently.

4.3.2.3. Pearson Analysis

Table 4.14: Correlation coefficient results

Correlations					
		F_LS	F_UTTH	F_CLM	F_QDLC
F_LS	Pearson Correlation	1	.339**	.487**	.557**
	Sig. (2-tailed)		0.000	0.000	0.000
	N	200	200	200	200
F_UTTH	Pearson Correlation	.339**	1	.514**	.501**
	Sig. (2-tailed)	0.000		0.000	0.000
	N	200	200	200	200
F_CLM	Pearson Correlation	.487**	.514**	1	.624**
	Sig. (2-tailed)	0.000	0.000		0.000
	N	200	200	200	200
F_QDLC	Pearson Correlation	.557**	.501**	.624**	1
	Sig. (2-tailed)	0.000	0.000	0.000	
	N	200	200	200	200
**. Correlation is significant at the 0.01 level (2-tailed).					

(Sources: Author compilation from primary data with SPSS 23)

The strength of correlation is evaluated based on the absolute value of r, with thresholds indicating very weak ($|r| < 0.1$), weak ($|r| < 0.3$), moderate ($|r| < 0.5$), and strong ($|r| \geq 0.5$) correlation (S. Sabilla et al., 2019).

In this study, the Pearson correlation coefficients between the dependent variable QDLC and independent variables approach 1, indicating strong linear correlation at a

99% confidence level. Moreover, all sig values for the correlation tests between independent variables and QDLC are 0.000, signifying significant linear relationships. Additionally, the sig coefficients between independent variables are all below 0.01, with correlation coefficients below 0.5. Specifically, the correlation between UTTH and CLM is significant at the 0.05 level (sig = 0.000 < 0.05), suggesting a correlation between independent variables with a low possibility of collinearity.

4.3.2.4. Linear regression analysis

4.3.2.4.1. Linear regression analysis on independent qualitative variables

Table 4.15: Results of coefficients analysis for qualitative variables

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	3,373	0.164		20,546	0		
	Sex	-0.035	0.05	-0.048	-0.7	0.485	0.941	1,063
	Age	0.03	0.032	0.078	0.958	0.339	0.668	1,496
	Education level	0.032	0.031	0.079	1,024	0.307	0.747	1,339
	Occupation	0.02	0.016	0.087	1,226	0.222	0.879	1,138
	Place of residence	-0.097	0.08	-0.091	-1,220	0.224	0.805	1,242
	Income	0.108	0.047	0.208	2,275	0.024	0.531	1,884
	Duration of using deposits	0.031	0.044	0.064	0.695	0.488	0.526	1,900

a. Dependent Variable: F_QDLC

(Sources: Author compilation from primary data with SPSS 23)

Results from the Coefficients table show that the regression model with linear variables is not appropriate due to the value of Sig. are all higher than the threshold of

0.05. Linear variables include Sex, Age, Education level, Occupation, Place of residence, Income, and Duration of using deposits have no impact on the dependent variable QDLC.

4.3.2.4.2. Linear regression analysis on independent quantitative variables

Model summary

Table 4.16: Model summary results

Model Summary[b]					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.710a	0.505	0.497	0.25182	1.824

a. Predictors: (Constant). F_CLM. F_LS. F_UTTH
b. Dependent Variable: F_QDLC

(Sources: Author compilation from primary data with SPSS 23)

In the Model Summary table, the adjusted R-squared value of 0.497 implies that the independent variables account for 49.7% of the variance in the dependent variable, leaving the remaining 50.3% attributable to factors beyond the model and random errors. Furthermore, the Durbin-Watson statistic, with a value of 1.824, falls within the range of 1.5 to 2.5, indicating no violation of the assumption of first-order serial autocorrelation (Yahua Qiao, 2011).

ANOVA Analysis

Table 4.17: Result of ANOVA Analysis

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	12.669	3	4.223	66.594	.000b
	Residual	12.429	196	0.063		
	Total	25.097	199			

a. Dependent Variable: F_QDLC
b. Predictors: (Constant). F_CLM. F_LS. F_UTTH

(Sources: Author compilation from primary data with SPSS 23)

The suitability of the regression model is assessed by testing the hypothesis H_0: $R^2 = 0$ using the F test. If the significance level (Sig) is less than 0.05, H_0 is rejected, indicating that $R^2 \neq 0$ in a statistically significant manner, thereby affirming the suitability of the regression model. Conversely, if Sig exceeds 0.05, H_0 is accepted, implying that $R^2 = 0$ in a statistically significant manner, indicating inadequacy of the regression model. In the ANOVA analysis results table, the F-test significance value is observed as 0.000, which is less than 0.05. Consequently, the regression model is appropriate.

Coefficients

Table 4.18: Results of regression analysis for quantitative variables

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	1.074	0.195		5.499	0.000		
	F_LS	0.267	0.050	0.308	5.314	0.000	0.752	1.330
	F_UTTH	0.135	0.038	0.208	3.519	0.001	0.726	1.378
	F_CLM	0.310	0.054	0.367	5.78	0.000	0.626	1.598

a. Dependent Variable: F_QDLC

(Sources: Author compilation from primary data with SPSS 23)

The significance values (Sig.) associated with the independent variables F_LS, F_UTTH, and F_CLM are all below 0.005, indicating their statistical significance within the model. Furthermore, the Variance Inflation Factor (VIF) values for these independent variables are all below 10, in this case even less than 2, suggesting the absence of multicollinearity.

Regression model (Unstandardized Coefficients)

$$QDLC = 1.074 + 0.267*F_LS + 0.135*F_UTTH + 0.31*F_CLM + \varepsilon$$

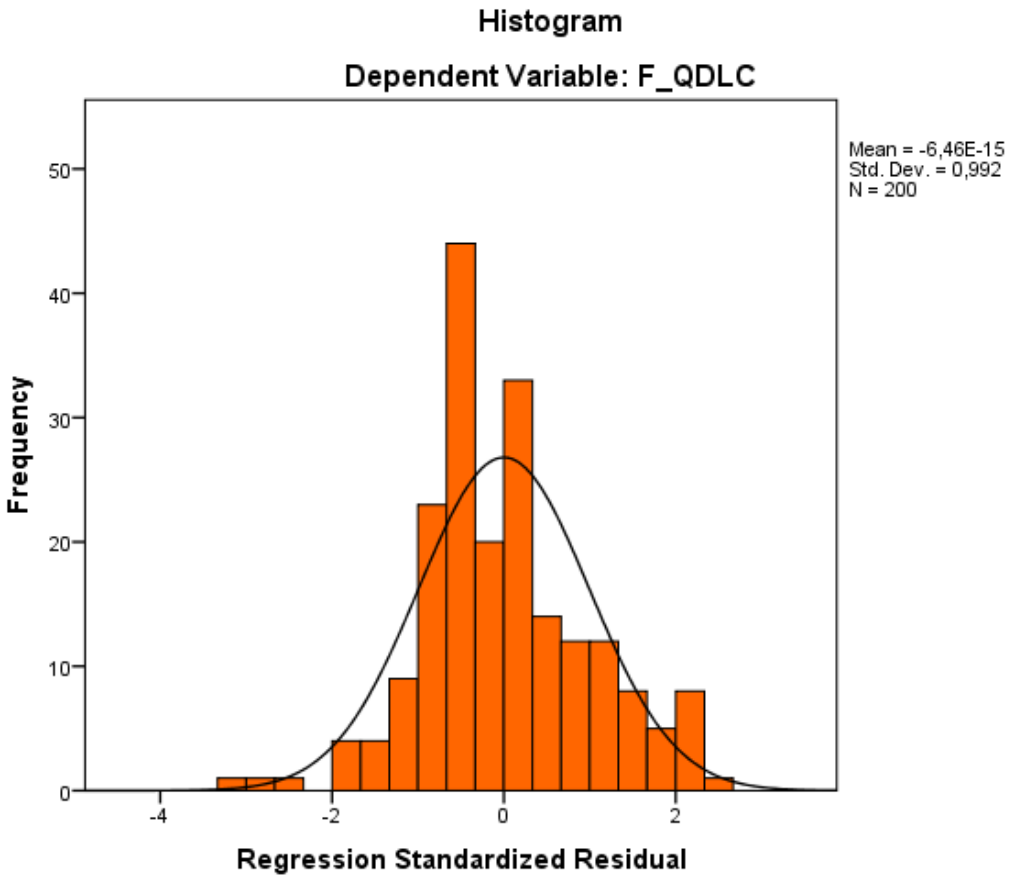

Regression model (Standardized Coefficients)

$$QDLC = 0.308*F_LS + 0.208*F_UTTH + 0.367*F_CLM + \varepsilon$$

The impact of deposit interest rates on customers' decisions regarding SHB's deposit services is indicated by a coefficient (B) of 0.267. This signifies that for each unit increase in customers' evaluation of deposit interest rates, while holding other factors constant, satisfaction levels are expected to increase by 0.267. Similarly, the influence of the bank brand's reputation on customers' decisions regarding SHB's deposit services with a coefficient (B) of 0.135 suggests that for every unit increase in customers' evaluation of the bank brand's reputation, satisfaction levels are anticipated to increase by 0.135, all other factors remaining unchanged. Finally, marketing efforts demonstrate a significant impact on customers' decisions regarding SHB's deposit services, as evidenced by a coefficient (B) of 0.31. In the absence of changes in other factors, a one-unit increase in customers' evaluation of marketing efforts corresponds to a satisfaction level increase of 0.31.

Evaluate regression assumptions through Histogram

Graph 4.10: Regression Standardized Residual assumptions through histogram

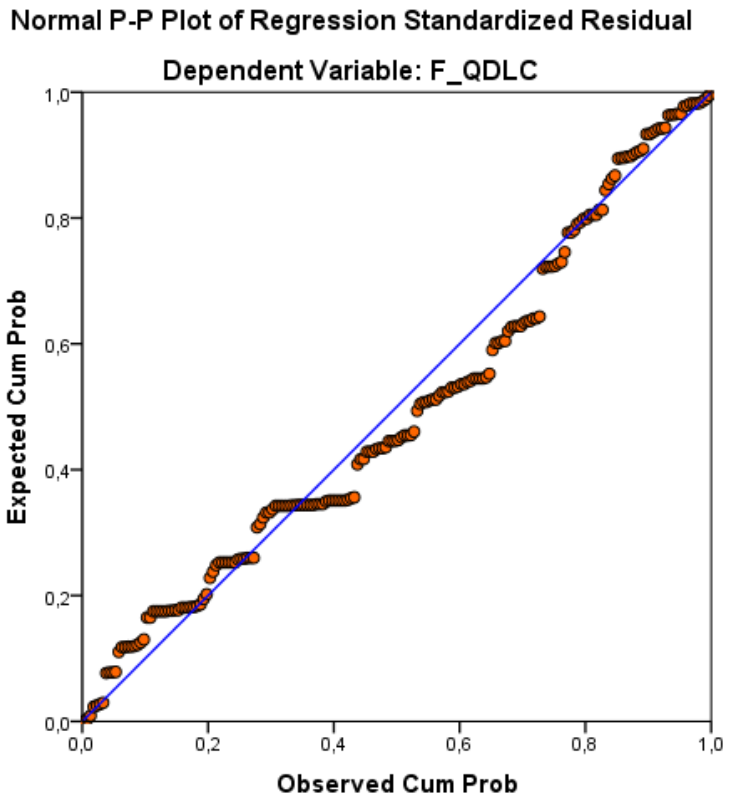

(Sources: Author compilation from primary data with SPSS 23)

The mean of the residuals is approximately zero, and the standard deviation is 0.992, which is close to one. Additionally, the residual values exhibit a bell-shaped distribution. These observations suggest that the residuals are likely to follow a normal distribution, implying that the assumption of normality for the residuals has not been violated.

Evaluate regression assumptions through Normal P-P Plot

The residual data points are closely aligned along the diagonal, indicating that the residuals conform to an approximately normal distribution. Consequently, the assumption of normality for the residuals appears to be valid.

Graph 4.11: Regression Standardized Residual assumptions through normal P-P Plot

(Sources: Author compilation from primary data with SPSS 23)

4.4. Discussion of the results

The primary data for this study was collected through surveys with 200 valid respondents, yielding responses that are pertinent to the research objectives. The collected data was subsequently processed using SPSS software to facilitate quantitative modeling. The descriptive statistics for the dependent variables include demographic and

socioeconomic factors such as sex, age, education level, occupation, place of residence, income, and duration of deposit usage.

The reliability of the scales was assessed using Cronbach's Alpha coefficient, revealing that the three components (LS, UTTH, CLM) developed in this study each have coefficients greater than 0.6. This indicates that the scales are sufficiently reliable for conducting Exploratory Factor Analysis (EFA). Following the reliability analysis, a regression analysis was performed, resulting in the development of the following regression model:

Regression model (Unstandardized Coefficients)

$$QDLC = 1.074 + 0.267*F_LS + 0.135*F_UTTH + 0.31*F_CLM + \varepsilon$$

Regression model (Standardized Coefficients)

$$QDLC = 0.308*F_LS + 0.208*F_UTTH + 0.367*F_CLM + \varepsilon$$

According to the regression analysis, it was found that among the factors examined, "marketing" exhibited the highest beta coefficient, indicating the most substantial influence on customers' decisions regarding depositing money. Following closely behind, "deposit interest rates" demonstrated the second strongest impact, while the reputation of the bank brand emerged as the least influential factor. These findings underscore the pivotal role of marketing strategies in shaping customer preferences and perceptions, followed by the significance of competitive deposit interest rates. Conversely, the impact of the bank's brand reputation appears comparatively minor in influencing customers' decisions on depositing funds.

The analysis highlights marketing as the most influential factor affecting customers' decisions to deposit money at SHB, with the highest beta coefficient. Effective marketing strategies, encompassing targeted campaigns, branding initiatives, and promotional activities, significantly shape customer perceptions and behaviors. Through targeted marketing strategies, such as advertising campaigns, promotional offers, and branding initiatives, SHB can effectively communicate the value proposition of its deposit products to potential customers. Consequently, marketing efforts play a pivotal role in attracting customers and encouraging them to choose SHB for their deposit needs.

The study underscores deposit interest rates as the second most impactful factor influencing customers' decisions at SHB, as evidenced by the corresponding beta coefficient. Competitive interest rates serve as a pivotal determinant for customers when selecting deposit options, as they directly affect the potential returns on their investments. By offering attractive interest rates that align with market expectations and customer preferences, SHB can enhance its appeal and competitiveness in the banking industry, thereby exerting a significant influence on customers' deposit decisions.

Despite its inherent importance, the reputation of SHB's brand emerges as the least impactful factor on customers' decisions to deposit money, as indicated by the lowest beta coefficient. While a strong brand reputation contributes to customer trust and loyalty, its influence appears to be outweighed by other factors, such as marketing and deposit interest rates. Customers may give a lower priority to brand reputation when deciding where to deposit their money since they are primarily concerned with factors such as financial benefits, promotional incentives, and perceived value propositions rather than brand reputation. SHB may need to reinforce its branding efforts and differentiate itself further to strengthen its position in the competitive deposit market, recognizing that brand reputation alone may not suffice to drive customer decisions regarding depositing funds.

CHAPTER 5: CONCLUSION

5.1. Recommendations for improving deposit mobilization from individual customers

5.1.1. Improving the marketing policies for deposit products for individual customers

The research findings underscore the significant impact of marketing on customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank (SHB), with a notable influence of 41.56% (Appendix 5). Given this substantial contribution to customer decision-making, enhancing marketing policies emerges as a critical imperative for SHB. An effective marketing strategy not only enhances the brand image but also effectively communicates the value of SHB's deposit services to prospective customers. By adapting marketing initiatives, SHB can distinguish its services in a competitive environment, attract a wider customer base, and ultimately strengthen its market share. This can be achieved through innovative advertising methods adjusted to leave a lasting impression and stimulate customer interest. In order to gain the confidence and trust of potential depositors, SHB ought to diversify the means by which it introduces deposit products beyond the conventional channels. SHB may strengthen its competitive advantage in the marketplace by improving its market position and attracting a larger client base through the utilization of specific advertisements that are directed towards particular groups of individual customers.

SHB may also improve its marketing strategies by frequently collecting market data to identify changing consumer preferences and expectations. This proactive strategy improves customer satisfaction by ensuring that deposit products are precisely customized to meet current market expectations. Furthermore, it is crucial to employ technological innovations to enhance convenience for deposit customers. Digital technologies may simplify and improve the accessibility and effectiveness of the deposit process. Through the implementation of these strategies, SHB not only improves the public's impression of its reputation but also effectively expresses the distinct value proposition of its deposit services, consequently strengthening its competitive position and expanding its market share within the banking industry.

5.1.2. Improving the deposit interest rates policies for individual customers

Improving the deposit interest rates policies for individual customers emerges as a critical initiative for SHB, given the research's revelation that Deposit interest rates impact 34.88% of customers' decisions regarding depositing money (Appendix 5). Interest rates are a key determinant for customers seeking to optimize returns on their deposits, and competitive rates can serve as a compelling incentive for customers to choose SHB over competitors. By adjusting and optimizing deposit interest rates policies, SHB can effectively align with market trends, respond to customer preferences, and enhance the attractiveness of its deposit products. Moreover, in order to preserve group of prospective customers, SHB should also update its own policy on priority customers' distinctive interest rates. This strategic adjustment not only enhances customer satisfaction but also positions SHB as a preferred choice for individuals seeking lucrative deposit opportunities, thereby driving customer acquisition and retention efforts.

In order to improve the effectiveness of its interest rate policies, SHB needs to guarantee that rates are disclosed in a transparent manner and modified on a frequent basis in accordance with regulatory requirements and market conditions. During transactions, bank staff should clearly explain interest calculation methods, payment policies, and benefits to customers. SHB may improve its services' attractiveness and competitiveness by providing customized options that align with a range of customer demands through the differentiation of interest rates depending on the features of individual deposit products. These strategies would enable SHB to build trust, foster a deeper understanding of its deposit products among customers, and ultimately drive customer acquisition and retention in a highly competitive market environment.

5.1.3. Improving the SHB’s reputation

Improving the reputation of Saigon – Hanoi Commercial Joint Stock Bank (SHB) is essential for strengthening its competitive position, particularly given that the brand's reputation influences 23.56% of customer decisions regarding deposits (Appendix 5). A strong brand reputation instills trust and confidence in consumers, serving as a key differentiator in a competitive market. To enhance brand reputation, SHB needs to focus on delivering exceptional customer experiences, maintaining transparency, and upholding ethical standards in all interactions. Addressing any negative feedback or issues

proactively is crucial to improving customer confidence and fostering stronger relationships. These initiatives will reinforce SHB's image as a reliable and ethical financial institution, fostering long-term relationships with customers who value trust and integrity.

In addition, increasing brand recognition and reputation can be achieved through active participation in community activities and a strong commitment to social responsibilities, especially with a focus on sustainable development. Moreover, SHB should also invest in improving its digital interfaces, including its website, social media platforms, and mobile applications. By demonstrating SHB's focus on development and customer satisfaction, a user-friendly website may create an excellent first impression and increase brand awareness. These strategic actions will help SHB enhance its brand reputation, thereby strengthening its position in the market and fostering long-term, trust-based relationships with its customers.

5.2. Conclusion

Strategic emphasis on capital mobilization, particularly the attraction of deposits from individual customers, has become essential for accomplishing specified objectives and strategies in the context of difficult capital mobilization growth and intense rivalry within the Vietnamese banking industry. The consistent long-term growth and steady expansion of the individual customer deposit base depend on this attention. Deposit services, including margin, demand, term, and special-purpose deposits, offer customers numerous options to deposit money. Therefore, it is critical to comprehend the factors affecting every customer's decision to make a deposit.

This study project attempts to thoroughly cover key factors relevant to comprehending and evaluating the decisions made by individual customers about making deposits at SHB. Firstly, it clarifies the conceptual framework of bank deposits, discusses the types and functions of this service for individual customers. Secondly, through quantitative modeling, the study identifies three factors exerting positive influence on customers' decisions to deposit money, thus illuminating customer perceptions and behaviors at SHB. Through the administration of 200 questionnaires targeting SHB depositors, and subsequent variable tests and linear regression analysis, three primary factors have been identified: Marketing, Deposit interest rates, and the Reputation of

SHB's brand. Finally, the study proffers strategic recommendations aimed at enhancing deposit services at SHB, thereby fostering customer attraction and facilitating the bank's expansion and future development endeavors.

In conclusion, the research highlights the significant factors influencing individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank (SHB), particularly emphasizing the roles of marketing, deposit interest rates, and brand reputation. The findings underscore the necessity for SHB to enhance its marketing strategies, optimize deposit interest rates policies, and strengthen its brand reputation to attract and retain customers effectively. However, the study's limitations, including the constrained sample size and the exclusive use of online data collection methods, suggest that the results may not fully represent the broader customer base. These limitations point to the need for further research employing more robust sampling techniques to ensure the findings' validity and generalizability. Overall, while the study provides valuable insights, it also lays the groundwork for more comprehensive investigations to better understand and address the factors impacting customer deposit decisions at SHB.

5.3. Limitations

This research is subject to several limitations that constrain its contribution to the exploration of the research topic. Firstly, the initial sampling strategy employed was rudimentary, resulting in a limited sample size that only represents a fraction of the customer base at one commercial bank in Vietnam. Consequently, the findings may not offer a comprehensive and precise assessment of the factors influencing individual customers' decisions to deposit money at Saigon – Hanoi Commercial Joint Stock Bank. Moreover, the reliance on a restricted sample size restricts the generalizability of the study's conclusions to a broader population of SHB customers.

Moreover, the research exclusively employed an online platform, specifically Google Forms accessed via smartphones, for data collection. This methodological choice was necessitated by constraints related to the study's duration and the availability of participants. However, it is important to acknowledge that this approach may introduce biases inherent in online data collection methods, potentially leading to skewed results and compromising the validity and reliability of the findings. Consequently, the generalizability of the research outcomes to the broader context of Saigon – Hanoi

Commercial Joint Stock Bank's (SHB) customer base may be compromised. Certain demographic segments or customer preferences might not be adequately represented in the online sample, thereby limiting the applicability of the findings. Therefore, it is recommended to exercise caution when deeply expanding the study's significance into the variables affecting SHB customers to make deposit decisions for a wider range of customers. Additional investigation with more resilient sampling techniques is necessary to improve the reliability and practicality of the findings.

Kính gửi Anh/chị!

Tôi là Đinh Vân Anh, hiện đang thực hiện Khóa luận tốt nghiệp tại Học viện Tài chính. Để có căn cứ đánh giá các nhân tố ảnh hưởng đến quyết định gửi tiền của khách hàng cá nhân tại Ngân hàng TMCP Sài Gòn-Hà Nội trong bài nghiên cứu khóa luận tốt nghiệp, kính mong anh/chị dành chút thời gian trả lời các câu hỏi sau bằng cách đánh dấu vào phương án trả lời anh/chị thấy phù hợp nhất để giúp tôi có những thông tin chính xác phục vụ cho quá trình nghiên cứu.

Tôi xin cam kết các thông tin trên bảng điều tra chỉ sử dụng cho mục đích nghiên cứu khóa luận tốt nghiệp, không sử dụng cho bất kỳ mục đích nào khác.

Xin chân thành cảm ơn!

PHẦN I: THÔNG TIN KHÁCH HÀNG

1. ***Anh/Chị vui lòng cho biết giới tính?***

☐ Nam

☐ Nữ

☐ Giới tính khác

2. ***Anh/Chị thuộc nhóm tuổi nào dưới đây?***

☐ Từ 16 – 30 tuổi

☐ Từ 31 – 45 tuổi

☐ Từ 46 – 60 tuổi

☐ Trên 60 tuổi

3. Trình độ học vấn của Anh/Chị?

☐ Chưa tốt nghiệp THPT

☐ Đã tốt nghiệp THPT

☐ Trung cấp, Cao đẳng

☐ Đại học

☐ Sau đại học

4. Nghề nghiệp hiện tại của Anh/Chị?

☐ Học sinh, sinh viên

☐ Cán bộ

☐ Doanh nhân

☐ Lao động tự do

☐ Nghỉ hưu

☐ Khác

5. Anh/Chị đang sinh sống, làm việc ở đâu?

☐ Thành phố

☐ Nông thôn

6. Thu nhập trung bình mỗi tháng của anh/chị là bao nhiêu?

☐ Dưới 10 triệu đồng

☐ Từ 11– 20 triệu đồng

☐ Trên 20 triệu đồng

7. Anh/chị đã gửi tiền tại SHB bao lâu?

☐ Dưới 1 năm

☐ 1 năm – 3 năm

☐ Nhiều hơn 3 năm

PHẦN II: KHẢO SÁT LẤY Ý KIẾN KHÁCH HÀNG VỀ NHÂN TỐ ẢNH HƯỞNG ĐẾN QUYẾT ĐỊNH GỬI TIỀN CỦA KHÁCH HÀNG CÁ NHÂN TẠI NGÂN HÀNG TMCP SÀI GÒN – HÀ NỘI

Anh/chị vui lòng cho biết mức độ đồng ý của anh/chị với các ý kiến, quan điểm dưới đây theo thang điểm từ 1 đến 5 với quy ước:

(1) Hoàn toàn không đồng ý

(2) Không đồng ý

(3) Bình thường

(4) Đồng ý

(5) Hoàn toàn đồng ý

STT	Tiêu chí đánh giá	Mức độ đánh giá				
I	**Chính sách lãi suất của tiền gửi KHCN**

2	Anh/chị sẵn sàng giới thiệu người quen gửi tiền tại SHB.	1	2	3	4	5
3	Anh/chị sẽ tiếp tục gửi tiền tại SHB trong thời gian tới.	1	2	3	4	5
4	Anh/chị luôn ưu tiên chọn SHB khi có nhu cầu gửi tiền.	1	2	3	4	5

Xin chân thành cảm ơn sự giúp đỡ của Anh/Chị!

Mong rằng Anh/Chị sẽ ngày càng thấy hài lòng khi sử dụng dịch vụ của SHB.

APPENDIX 2: SURVEY FORM (English)

ACADEMY OF FINANCE	**SOCIALIST REPUBLIC OF VIETNAM**
Institute of International Finance Education	**Independence – Liberty - Happiness**

SURVEY FORM FOR INDIVIDUAL CUSTOMERS USING MONEY DEPOSIT SERVICES AT SAIGON - HANOI COMMERCIAL JOINT STOCK BANK

Dear Sir/Madam!

I am Dinh Van Anh, and I am currently doing my graduation thesis at the Academy of Finance. To have a basis for evaluating the factors affecting individual customers' decisions to deposit money at Saigon-Hanoi Commercial Joint Stock Bank in my graduation thesis research, I hope you will take some time to answer. Please check the following questions by ticking the answer you think is most appropriate to help me have accurate information for the research process.

I commit that the information on the questionnaire will only be used for the purpose of researching my graduation thesis and will not be used for any other purpose.

Sincerely thank!

PART I: GENERAL INFORMATION

1. ***What is your gender?***

☐ Male

☐ Female

☐ Other

2. ***Which age group do you belong to?***

☐ 16 – 30 years old

☐ 31 – 45 years old

☐ 46 – 60 years old

☐ Over 60 years old

3. What is your education level?

☐ Undergraduated from high school

☐ High school

☐ Intermediate college

☐ Bachelor's degree

☐ Postgraduate

4. What is your occupation?

☐ What's your occupation

☐ Officer

☐ Businessmen/ women

☐ Freelancer

☐ Retirement

☐ Others

5. Where do you live?

☐ City

☐ Countryside

6. What is your average monthly income??

☐ Under 10 VND million

☐ 11-20 VND million

☐ Over 20 VND million

7. How long have you deposited money at SHB?

☐ Under 1 year

☐ 1-3 years

☐ Over 3 years

PART II: RESEARCH TO OBTAIN A PERSONALLY OPINION OF THE FACTORS IMPACTING EACH CUSTOMER'S DECISION TO DEPOSIT MONEY AT SAIGON - HANOI COMMERCIAL JOINT STOCK BANK.

Please indicate your level of agreement with the following opinions and views on a scale of 1 to 5 according to the convention:

(1) Completely disagree

(2) Disagree

(3) Normal

(4) Agree

(5) Completely agree

Number	Evaluation criteria	Level of agreement				
I	**Deposit interest rates (LS)**					
1	SHB has transparently announced interest rates for individual customer deposits.	1	2	3	4	5
2	SHB has preferential interest rates for priority customers.	1	2	3	4	5
3	SHB's individual deposit interest rates are competitive.	1	2	3	4	5
4	SHB always provide clients an in-depth explanation of interest rates and how to compute interest.	1	2	3	4	5
II	**Bank brand (UTTH)**					
1	SHB has a high level of recognition.	1	2	3	4	5
2	SHB has a well-established reputation.	1	2	3	4	5
3	SHB is an established financial institution with a longstanding presence in Vietnam.	1	2	3	4	5
4	SHB has been widely recognized with numerous prestigious awards for its products and services for individual customers.	1	2	3	4	5
III	**Bank staff (CSKH)**					
1	The service manner of SHB team is impressive and professional.	1	2	3	4	5

2	SHB always responds rapidly to customer inquiries andgrievances	1	2	3	4	5
3	Staff of the bank handle transactions quickly and accurately.	1	2	3	4	5
4	Staff at SHB always offer comprehensive products and customer service channel recommendations.	1	2	3	4	5
IV	**Safety (ATTG)**					
1	Customer information security is a top priority for SHB.	1	2	3	4	5
2	SHB consistently offers thorough guidance to customers regarding measures ensuring the safety of their deposits..	1	2	3	4	5
